

# CREATE YOUR OWN APP(BASIC)

WITH APP INVENTOR 2

## Features:-

- 25 Basic Android Apps Tutorials.
- Easy-to-Follow with screenshot given for each step.
- All colored Pages
- App Based Learning and Interactive Design
- No coding or Programming Experience Required to use this book.

RUPESH TIWARI

# **Contents**

**Chapter 1** : Introduction to APP INVENTOR 2

**Chapter 2** : Text-to-Speech App

**Chapter 3** : Kitten Meow App

**Chapter 4** : GetMyAddress(GPS) App

**Chapter 5** : DrawObject App

**Chapter 6** : Shaking Colors App

**Chapter 7** : Digital Compass App

**Chapter 8** : Camera App

**Chapter 9** : Digital Doodle App

**Chapter 10:** Translator App

**Chapter 11:** Translator App (Extended)

**Chapter 12:** Mp3 Player App

**Chapter 13:** Video Player App

**Chapter 14:** Speech Recognizer App

**Chapter 15:** AI Ball App

**Chapter 16:** Magic Trick App

**Chapter 17:** Live FM App

**Chapter 18:** Bounce Ball App

**Chapter 19:** Sketch-A drawing app

**Chapter 20:** Texting-A messaging app

**Chapter 21:** Photo share app

**Chapter 22:** Proximity Sensor app

**Chapter 23:** Image Picker app

**Chapter 24:** Phone call app

**Chapter 25:** Flash Bird app

**Chapter 26:** Flash Bird Game

**Chapter 27:** Packaging & Publishing to Google Play Store

## **Chapter 1: Introduction to APP INVENTOR 2**

## What is App Inventor 2?

MIT App Inventor is an innovative beginner's introduction to programming and app creation that transforms the complex language of text-based coding into visual, drag-and-drop building blocks. The simple graphical interface grants even an inexperienced novice the ability to create a basic, fully functional app within an hour or less. You just need to open below link in your browser.

<http://ai2.appinventor.mit.edu/>

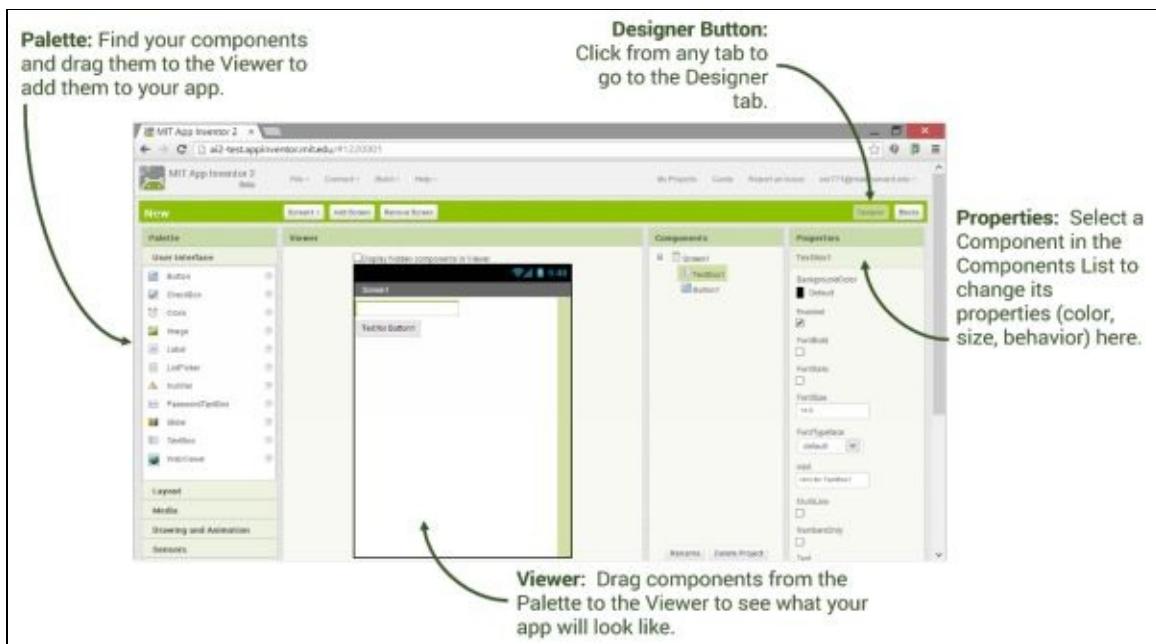

## Overview of App Inventor

Every Android app consists of two Parts:-

1. **Frontend Design** (Look and feel of Android app) i.e, App Screen .Frontend Design is created using Designer in App inventor 2.
2. **Backend Logic** (This contains the logic which will decides how our app will work).Backend Logic is created in the Blocks Editor.

App Inventor consists of the Designer and the Blocks Editor. These are described in detail below.

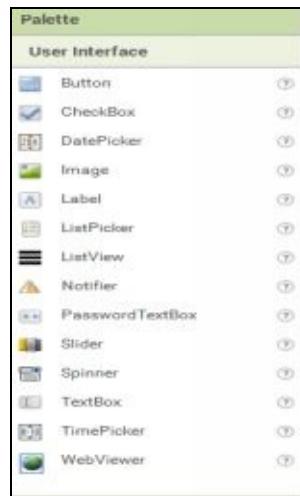

### Designer:-

### Palette:-

It has different types of Visible components (e.g, Textbox, image which will be displayed on app screen) and Non-Visible components (e.g, Camera, Player which will not be displayed on the app screen but will be used when we will create Backend Logic) which we can use to design our app screen:-

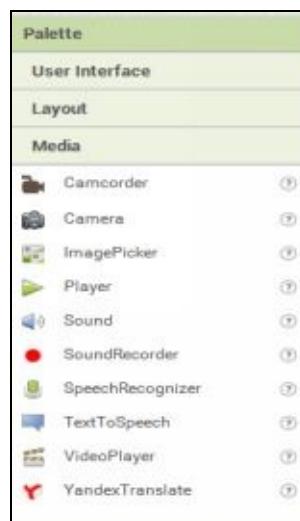

#### 1. User Interface:

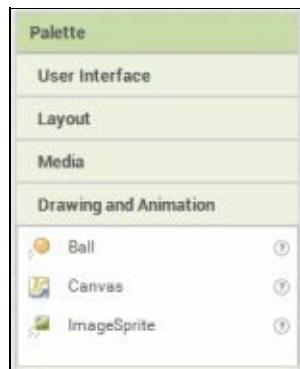

## 2. Layout:

## 3. Media:

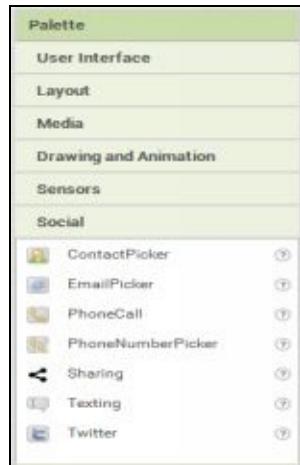

## **4. Drawing and Animation:**

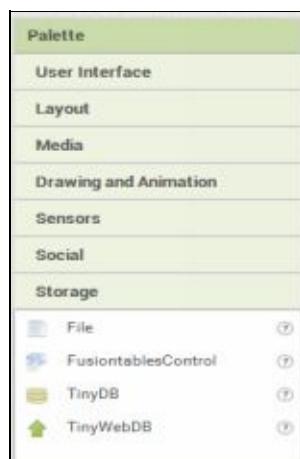

## **5. Sensors:**

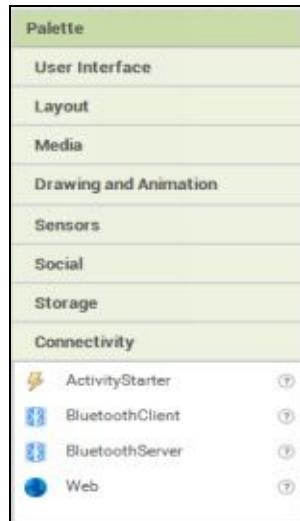

## **6. Social:**

## 7. Storage:

## 8. Connectivity:

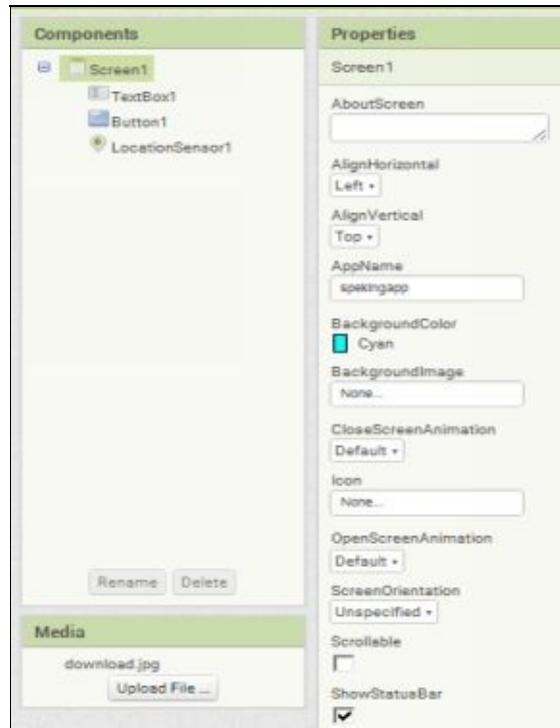

### **Viewer:-**

In viewer you will see how your app screen will look like and what components will be shown on your app screen.

### **Components and Properties:-**

Under components you will be able to see all the objects/Components added to your app and Under Properties Tab you will see Component/Object related properties which you can modify.

## Blocks Editor:-

**Built-In Drawers:** Find Blocks for general behaviors you may want to add to your app and drag them to the Blocks Viewer.

**Component-Specific Drawers:** Find Blocks for behaviors for specific Components and drag them to the Blocks Viewer.

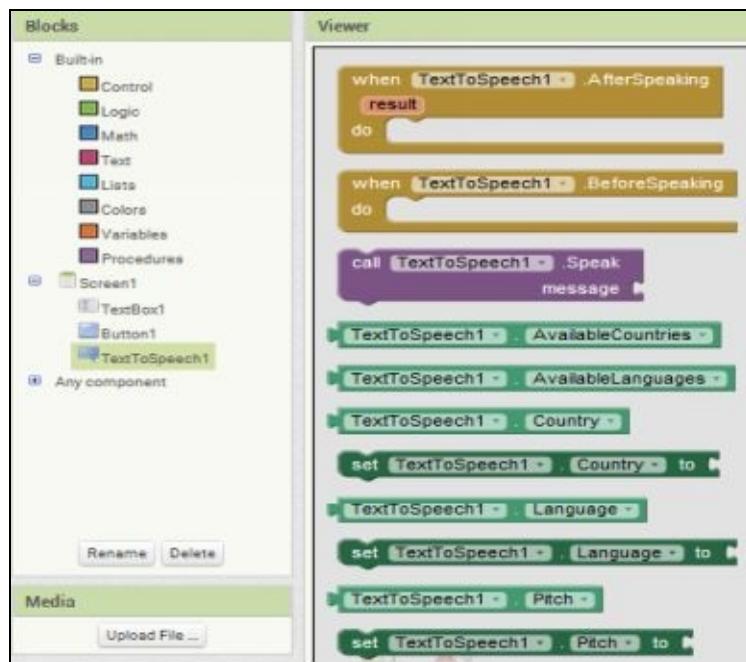

**Blocks Button:** Click from any tab to go to the Blocks tab.

**Block:** Snap Blocks together to set app behavior.

**Viewer:** Drag Blocks from the Drawers to the Blocks Viewer to build relationships and behavior.

## **Blocks:-**

Under Blocks all the visible and non-visible components will be shown and when you click on a component you will see all the associated logic blocks which you can use to create your app logic.

## Viewer

## Setting up App Inventor and Testing APP:-

You can use App Inventor without downloading anything to your computer! You'll develop apps on website: [ai2.appinventor.mit.edu](http://ai2.appinventor.mit.edu). To do live testing you can use one of the below options:-

- 1) **Live testing on your Android Device (Phone/Tablet/etc...)**

Test it in real-time on your device

## Step 1: Download and install the MIT AI2 Companion App on your phone.

After downloading, step though the instructions to install the Companion app on your device. You need to install the MIT AI2 Companion only once, and then leave it on your phone or tablet for whenever you use App Inventor.

**Note 1:** If you are unable to use the QR code, you can still install MIT AI2 Companion on your phone or tablet. Use the Web browser on your device to go to the Google Play Store; look for MIT AI2 Companion in the store. Once you find Companion, click the INSTALL button for the Companion app.

**Note 2:** If you choose not to go through the Play store and instead load the app directly (aka “side load”), you will need to enable an option in your device’s settings to allow installation of apps from “unknown sources”. To find this setting on versions of Android prior to 4.0, go to “Settings > Applications” and then check the box next to “Unknown Sources”. For devices running Android 4.0 or above, go to “Settings > Security” or “Settings > Security & Screen Lock” and then check the box next to “Unknown Sources” and confirm your choice.

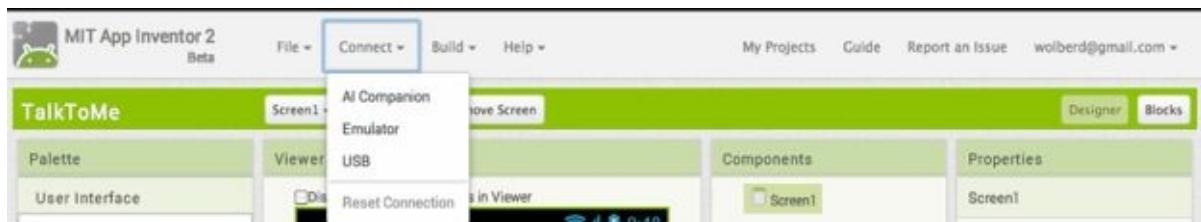

## Step 2: Connect both your computer and your device to the SAME WiFi Network

App Inventor will automatically show you the app you are building, but only if your computer (running App Inventor) and your Android device (running the Companion) are connected to the same WiFi Network.

## Step 3: Open an App Inventor project and connect it to your device

Go to App Inventor and open a project (or create a new one — use *Project > Start New Project* and give your project a name).

Then Choose “Connect” and “AI Companion” from the top menu in the AI2 browser:

A dialog with a QR code will appear on your PC screen. On your device, launch the MIT App Companion app just as you would do any app. Then click the “Scan QR code” button on the Companion, and scan the code in the App Inventor window:

Within a few seconds, you should see the app you are building on your device. It will update as you make changes to your design and blocks, a feature called “live testing”.

If you have trouble scanning the QR code or your device does not have a scanner, type the code shown on the computer into the Companion’s text area on your Android device exactly as shown. The code is directly below where the screen on your PC shows “Your code is” and consists of six characters. Type the six characters and choose the orange “Connect with code”. Do not type an Enter or carriage return: type just the six characters followed by pressing the orange button.

## 2. Installing and Running the Emulator in AI2

If you do not have an Android phone or tablet, you can still build apps with App Inventor. App Inventor provides an Android emulator, which works just like an Android but appears on your computer screen.

## **Step1:-Installing App Inventor 2 Setup on Windows**

Installing the Windows software for App Inventor Setup has two parts:

1. Installing the App Inventor Setup software package. This step is the same for all Android devices, and the same for Windows XP, Vista, and 7.
2. If you choose to use the USB cable to connect to a device, then you'll need to [install Windows drivers](#) for your Android phone.

**NOTE:** App Inventor 2 does not work with Internet Explorer. For Windows users, we recommend using either [Chrome](#) or [Firefox](#) as your browser for use with App Inventor.

### **Installing the App Inventor Setup software package**

---

You must perform the installation from an account that has administrator privileges. Installing via a non-administrator account is currently not supported.

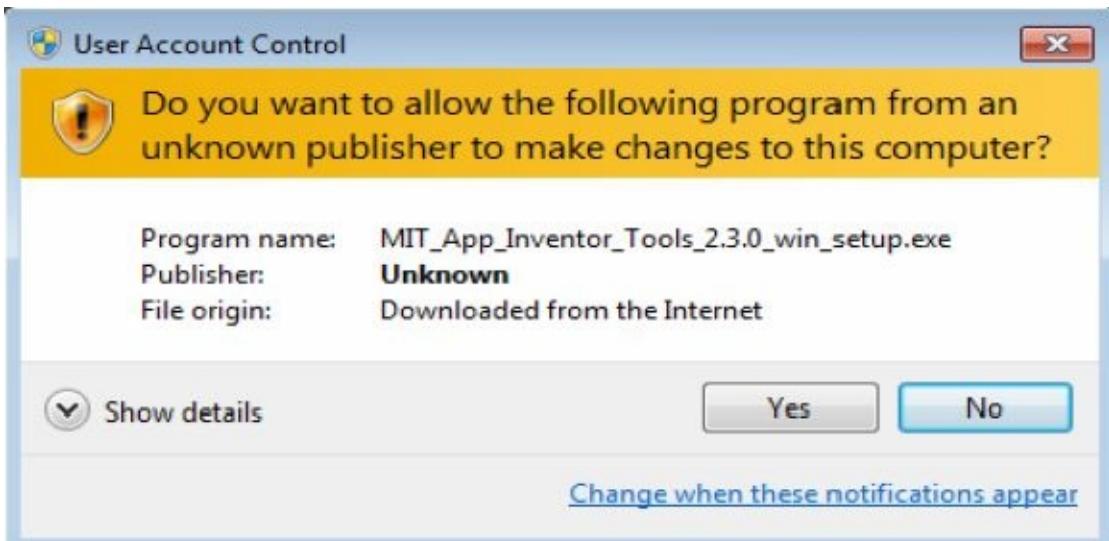

If you have installed a previous version of the App Inventor 2 setup tools, you will need to uninstall them before installing the latest version.

Follow the instructions given below:-

### **Installing App Inventor 2 Setup on Windows**

Download the installer from [http://appinv.us/aisetup\\_windows](http://appinv.us/aisetup_windows)

1. Locate the file MIT\_Appinventor\_Tools\_2.3.0 (~80 MB) in your Downloads file or your Desktop. The location of the download on your computer depends on how your browser is configured.
2. Open the file.
3. Click through the steps of the installer. Do not change the installation location but record the installation directory, because you might need it to check drivers later. The directory will differ depending on your version of Windows and whether or not you are logged in as an administrator.
4. You may be asked if you want to allow a program from an unknown publisher to make changes to this computer. Click yes.

## Locating the Setup software

In most cases, App Inventor should be able to locate the Setup software on its own. But if it asks for the location of the software, the path to enter is C:\Program Files\Appinventor\commands-for-Appinventor. If you are using a 64-bit machine you should type Program Files (x86) rather than Program Files. Also, if you did not install the software as an administrator, it was installed in your local directory rather than in C:\Program Files. You'll need to search for it to find the correct pathname.

## Installing App Inventor 2 Setup on Mac OS X

To get the Android emulator for your Mac, download and install the Setup Package. Click the blue link below to begin the download.

Download the installer from [http://appinv.us/aisetup\\_mac](http://appinv.us/aisetup_mac)

1. Double-click the downloaded file to start the installer. (You may need to look in your browser's downloads folder. The file is named AppInventor\_Setup\_v\_X.X.dmg (where the X.X is the version number))
2. Click continue.

3. Read and accept the software license agreement.
4. On the Standard Install screen, click Install. Don't change the install location

5. If asked, enter your password to confirm that you really want to install software. Click OK.
6. The installer confirms that the App Inventor Setup package was installed.

7. If you are updating a previous version of the setup software, log out and log back in before continuing to use App Inventor

## Installing App Inventor 2 Setup on GNU/Linux

You'll need sudo privileges to do the installation.

**Note:** The setup programs are 32-bit software. If you have a 64-bit system you may need to install libraries to let your machine run 32-bit software. One way to do this is to run the

command `sudo apt-get install lib32z1`, but this might not work on all GNU/Linux distributions, and you may need to do some investigation for your particular system.

If you have previously installed the App Inventor setup software, you should remove those files before installing the new software:

**`sudo rm -rf /usr/google/appinventor`**

**`sudo rm -rf ~/.appinventor`**

### **Instructions for systems that can install Debian packages**

---

Use these instructions for systems that can install Debian packages (e.g. Debian or Ubuntu):

**Note:** If you previously installed the setup package for App Inventor Classic, you should remove it, since it can interfere with the new installation. Remove the package with `sudo apt-get remove appinventor-setup`.

Download the [http://appinv.us/aisetup\\_linux\\_deb](http://appinv.us/aisetup_linux_deb). This is a file named `appinventor2-setup_2.3_all.deb`. It is a Debian package installer file. The place it will end up on your computer depends on how your browser is configured. Typically, it will go into your Downloads folder.

1. If your system can install packages simply by clicking on the package file, then do that.

2. If your system doesn't support clickable package installers, then navigate to the directory where the file is located and run the command

**`sudo dpkg —install appinventor2-setup_2.3_all.deb`**

With either method, you might need to ensure that the deb file as well as the directory it's in are world readable and world executable. On some systems, sudo does not have the default privileges to read and execute all files.

3. The software will be installed under `/usr/google/appinventor`.

You might also need to configure your system to detect your device. See the Android developer instructions at <http://developer.android.com/tools/device.html#setting-up>. Follow the instructions under the step "set up your system to detect your device" in the bullet under

“If you’re developing on Ubuntu Linux”.

## Instructions for other GNU/Linux systems

---

Download the [http://appinv.us/aisetup\\_linux\\_other](http://appinv.us/aisetup_linux_other). This is a file named appinventor2-setup\_2.3.tar.gz. It is a Gzip compressed tar file.

1. Install the files using a method appropriate to your operating system. You’ll need to check that the commands-for-Appinventor directory ends up under/usr/google/appinventor.

## Starting aiStarter

---

The aiStarter program manages communication between the Web browser and the Android device. It must be running whenever people use the emulator or the USB cable; it does not need to be running when people are using the wireless companion. Whenever someone logs in to use App Inventor with the emulator or USB, they will need to start aiStarter. This can be done with the command

**/usr/google/appinventor/commands-for-Appinventor/aiStarter &**

For convenience, you might want to arrange for this command to be run automatically whenever someone logs in, or when the system starts. The precise way to do this depends on which GNU/Linux distribution you are using. Consult the documentation for your distribution.

## Locating the Setup directory

---

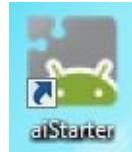

In most cases, App Inventor should be able to locate the installed Setup software on its own. If it does ask you where the software is located, the directory path you should enter is

**/usr/google/appinventor/commands-for-Appinventor**

## Step 2. Launch aiStarter

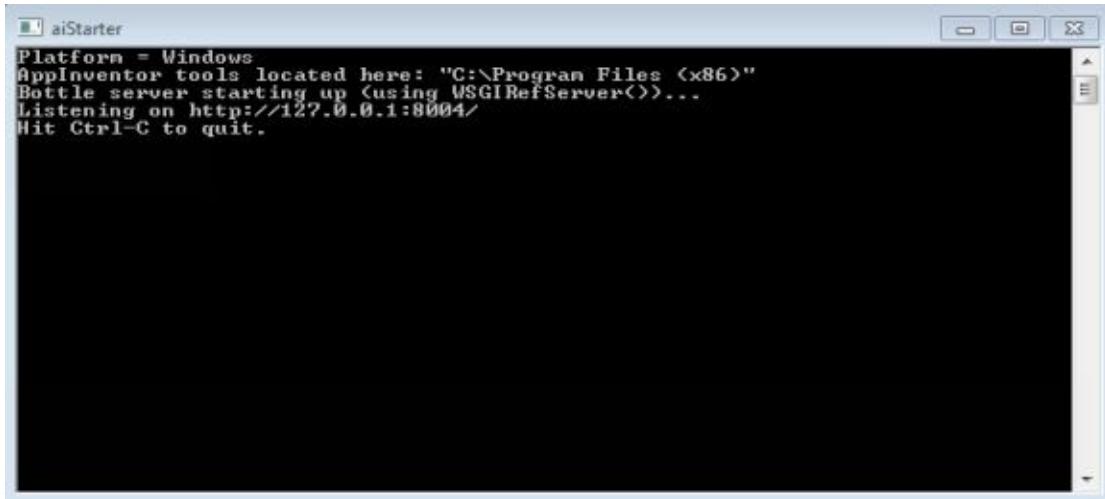

Using the emulator or the USB cable requires the use of a program named *aiStarter*. This program is the helper that permits the browser to communicate with the emulator or USB cable. The aiStarter program was installed when you installed the App Inventor Setup package. You do not need aiStarter if you are using only the wireless companion.

- On a Mac, aiStarter will start automatically when you log in to your account and it will run invisibly in the background.
- On Windows, there will be shortcuts to aiStarter from your Desktop, from the Start menu, from All Programs and from Startup Folder. If you want to use the emulator with App Inventor, you will need to manually launch aiStarter on your computer when you log in. You can start aiStarter this by clicking the icon on your desktop or using the entry in your start menu.

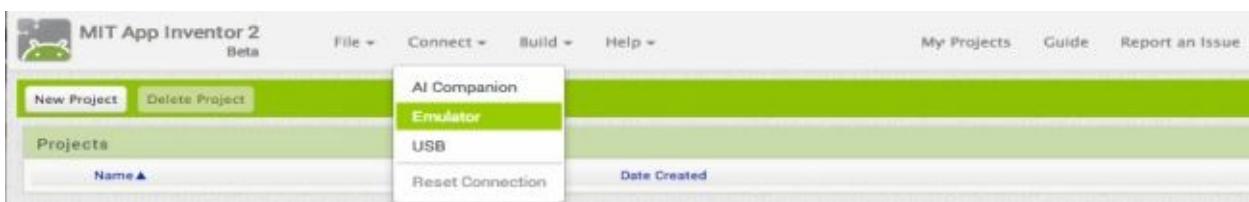

The aiStarter Icon on Windows

To launch aiStarter on Windows, double click on the icon (shown above). You'll know that you've successfully launched aiStarter when you see a window like the following:

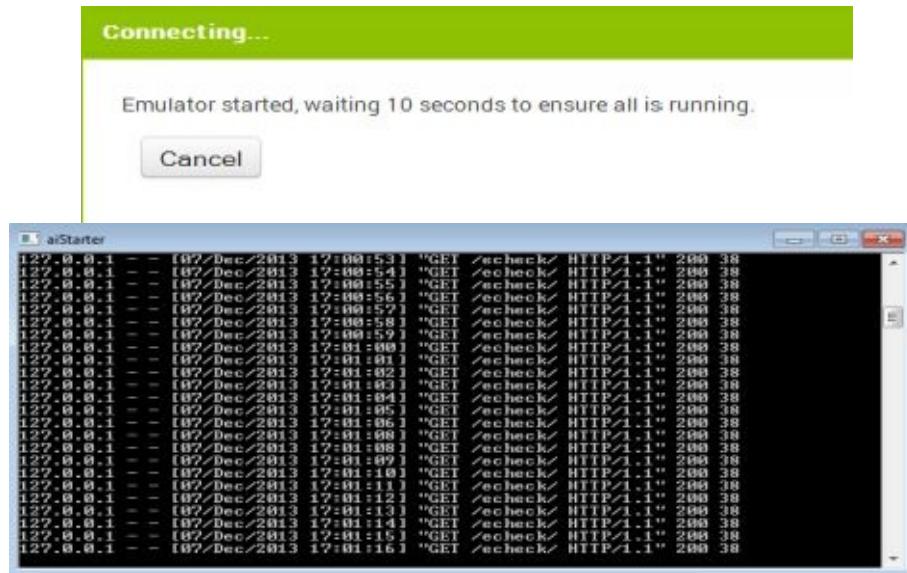

### Step 3. Open an App Inventor project and connect it to the emulator

First, go to App Inventor and open a project (or create a new one — use *Project > Start New Project* and give your project a name). Then, from App Inventor's menu (on the App Inventor cloud-based software at [ai2.appinventor.mit.edu](http://ai2.appinventor.mit.edu)), go to the Connect Menu and click the Emulator option.

You'll get a notice saying that the emulator is connecting. Starting the emulator can take a

couple of minutes. You may see update screens like the following as the emulator starts up:

The emulator will initially appear with an empty black screen (#1). Wait until the emulator is ready, with a colored screen background (#2). Even after the background appears, you should wait until the emulated phone has finished preparing its SD card: there will be a notice at the top of the phone screen while the card is being prepared. When connected, the emulator will launch and show the app you have open in App Inventor.

If this is the first time you are using the emulator after installing the App Inventor Setup software, you will see a message asking you to update the emulator. Follow the directions on the screen to perform the update and reconnect the emulator. You will need to do this kind of update whenever there is a new version of the App Inventor software.

## Reference

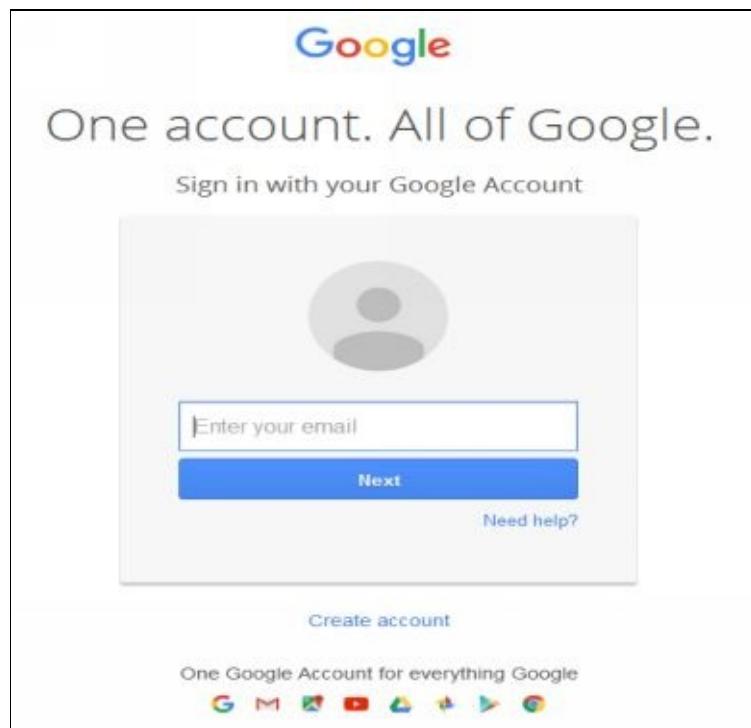

- <http://appinventor.mit.edu>

## Chapter 2: Text-to-Speech App

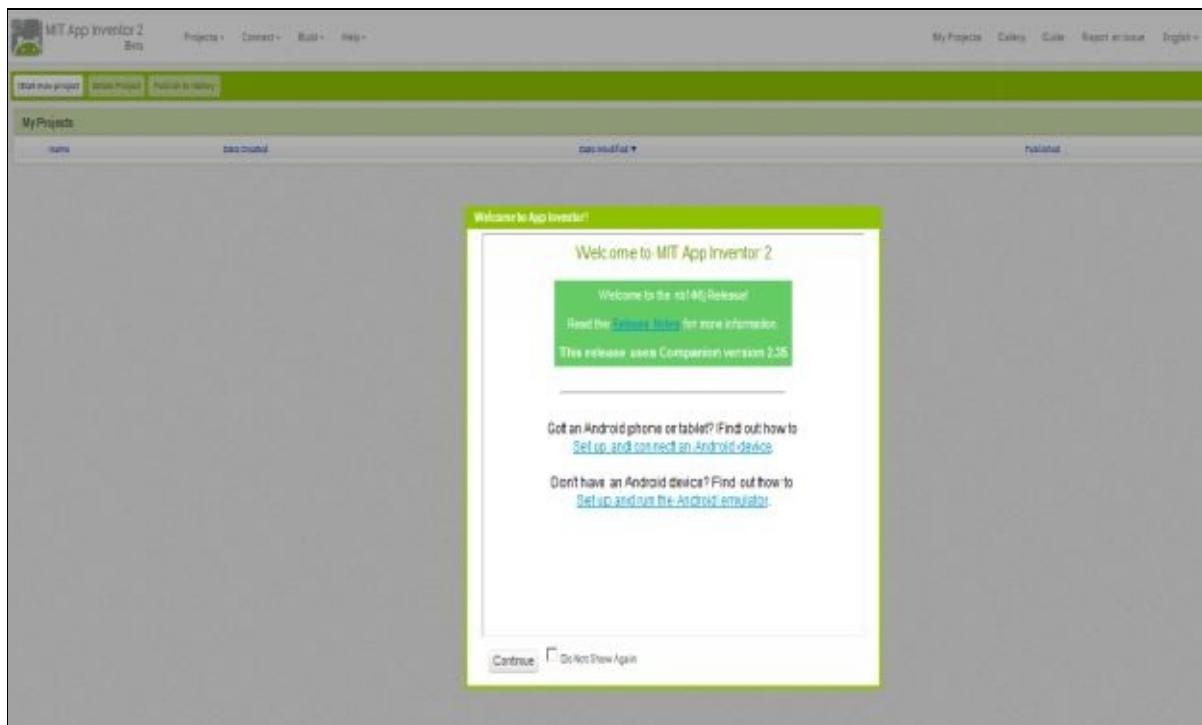

**Resources:**-All the media files/other objects used in this book can be downloaded to your local computer by just opening this link in your browser :<https://docs.google.com/uc?id=0B2muK1BF0y2haGlRdE1VdElZVUU&export=download>

1. Connect to <http://ai2.appinventor.mit.edu> and Login to your Gmail account. If you

don't have one then create a gmail account first.

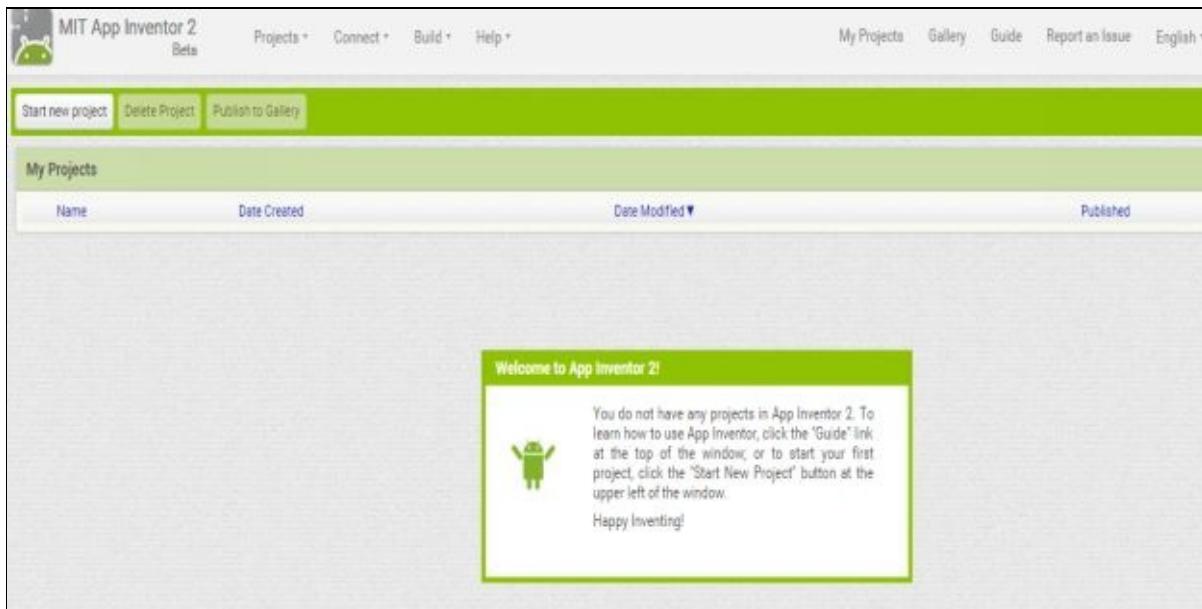

2. When you login to App Inventor you will see the below screen. Click [Continue](#).

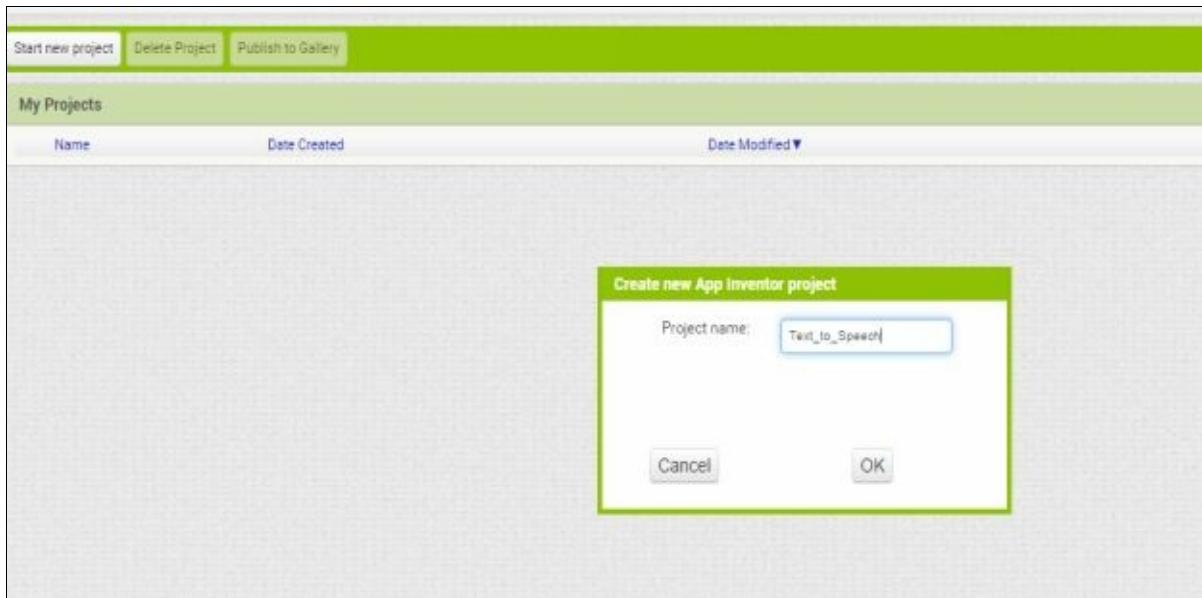

3. When you login for the first time you will not be able to see any Projects. So it will

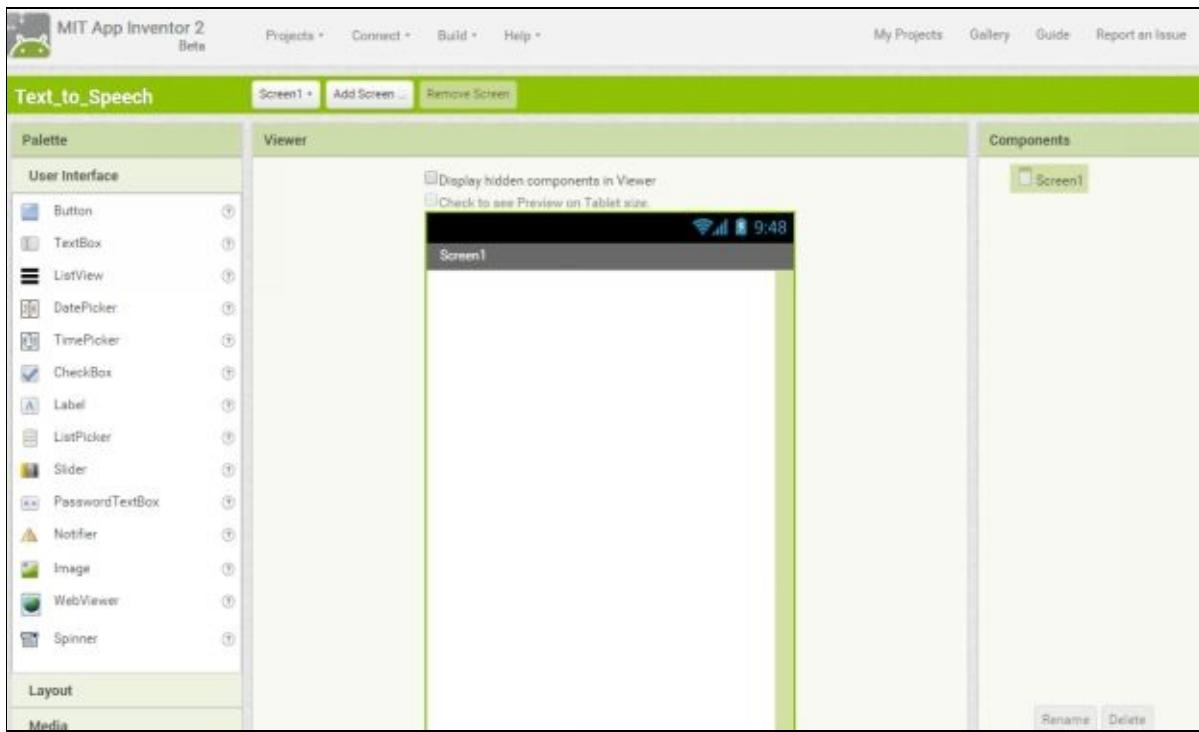

show Blank Screen.

4. Click on **Start new project** and give it name **Text\_to\_Speech**. And click **Ok**.

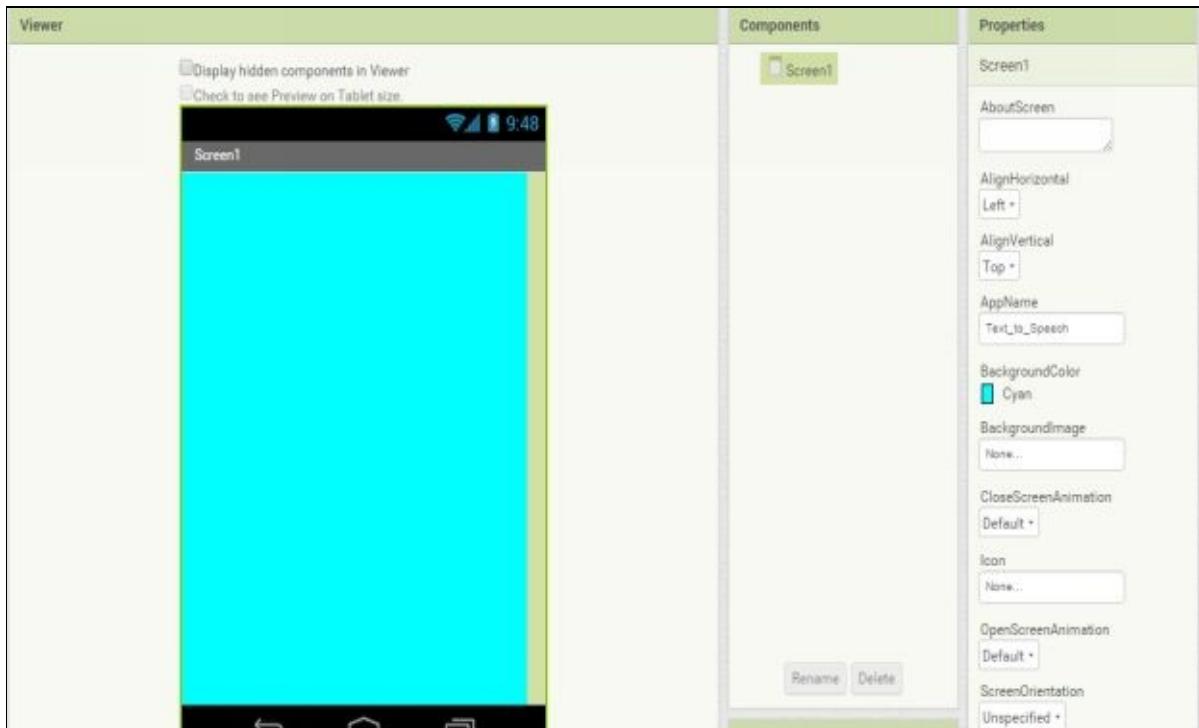

5. When you click OK you will see below screen.

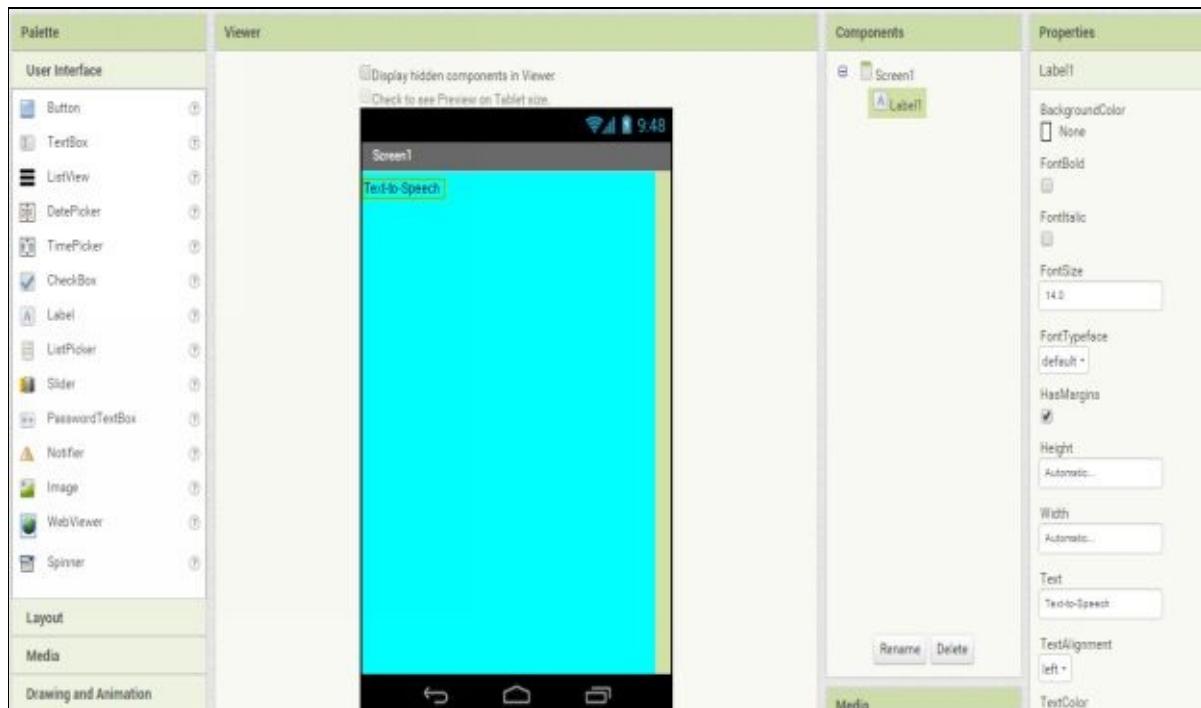

6. Now perform below actions:

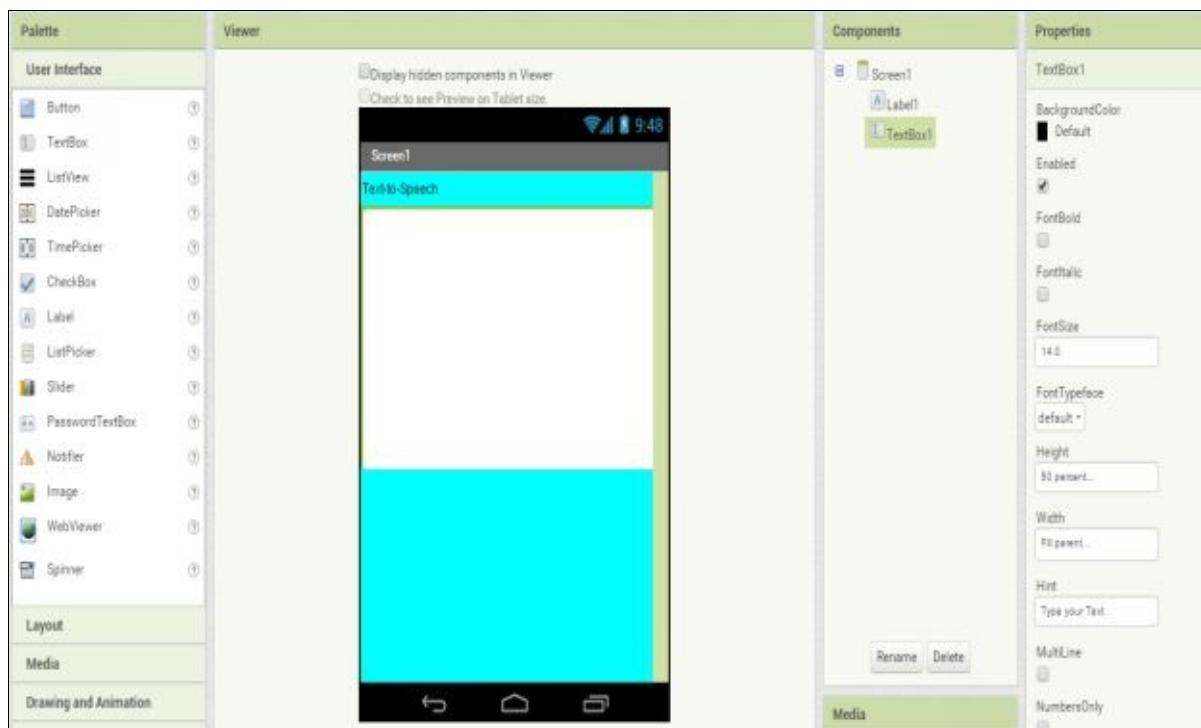

1. Select **Screen1** in **Components** and change its **BackgroundColor**.

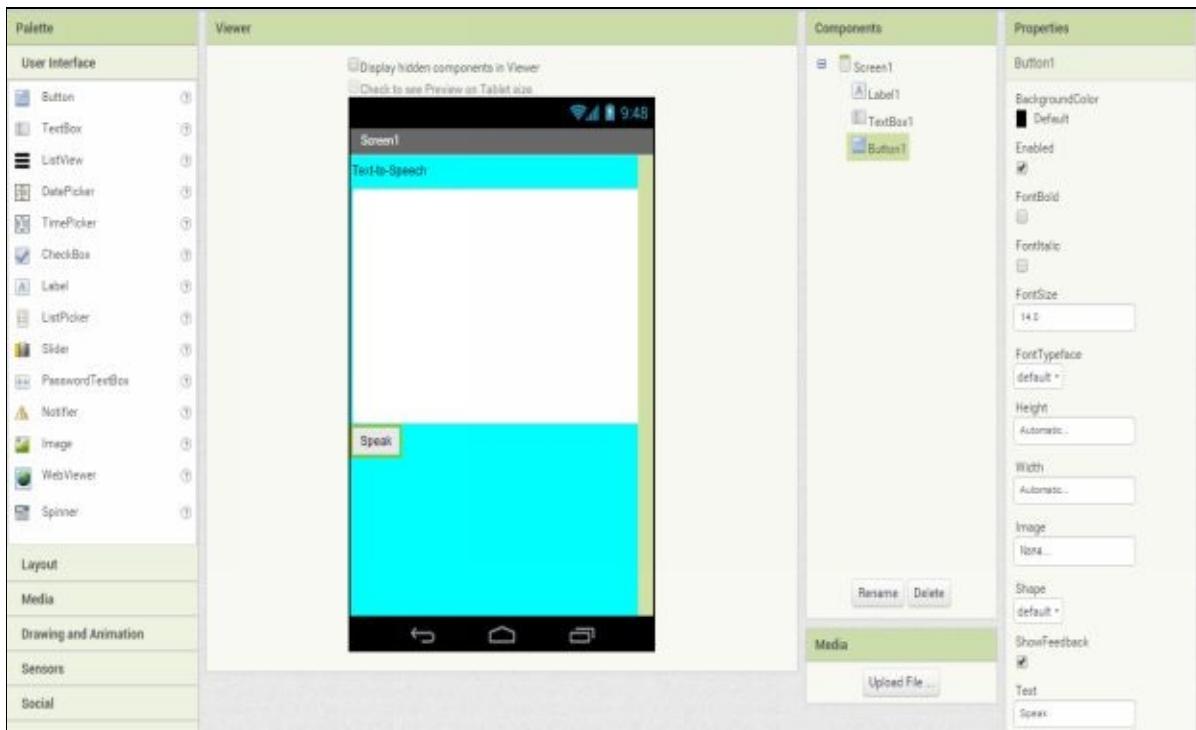

2. Drag a **Label** from **Palette** to **Screen1** and change its **Text** to **Text-to-Speech**.

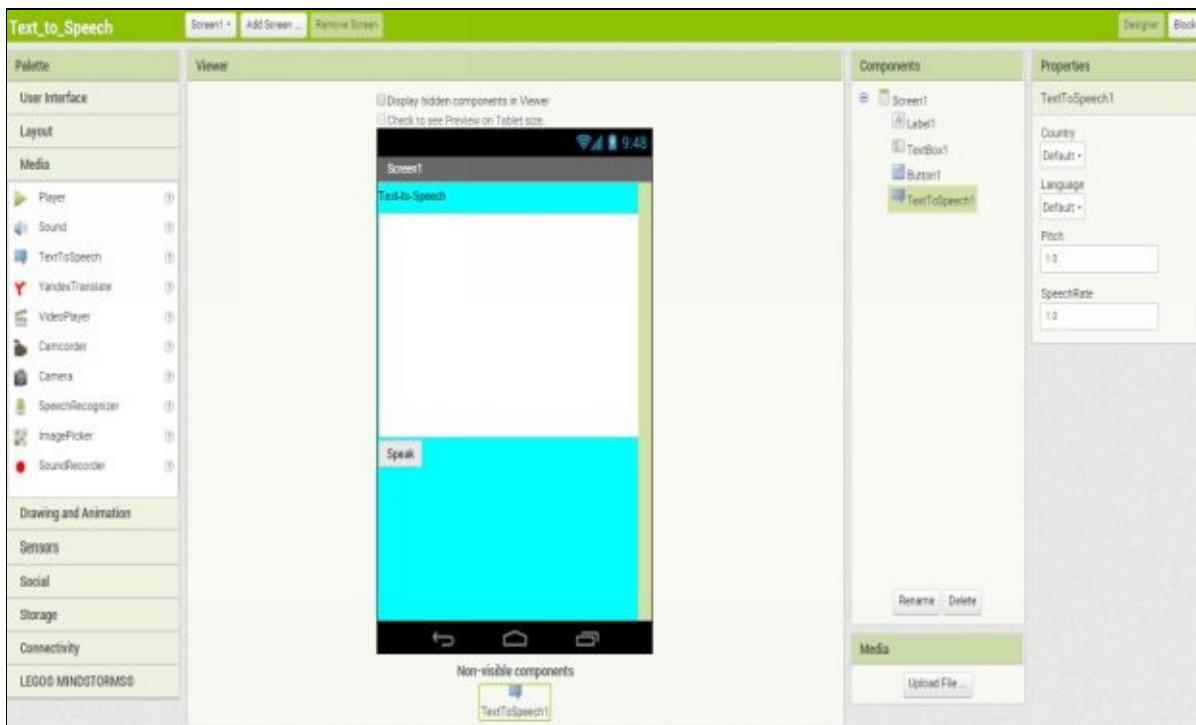

3. Drag a **TextBox** from **Palette** to **Screen1** and set its **Height** to 50 percent and **width** to **Fill Parent**.

4. Drag a button to **Screen1** and change its **Text** to **Speak**.

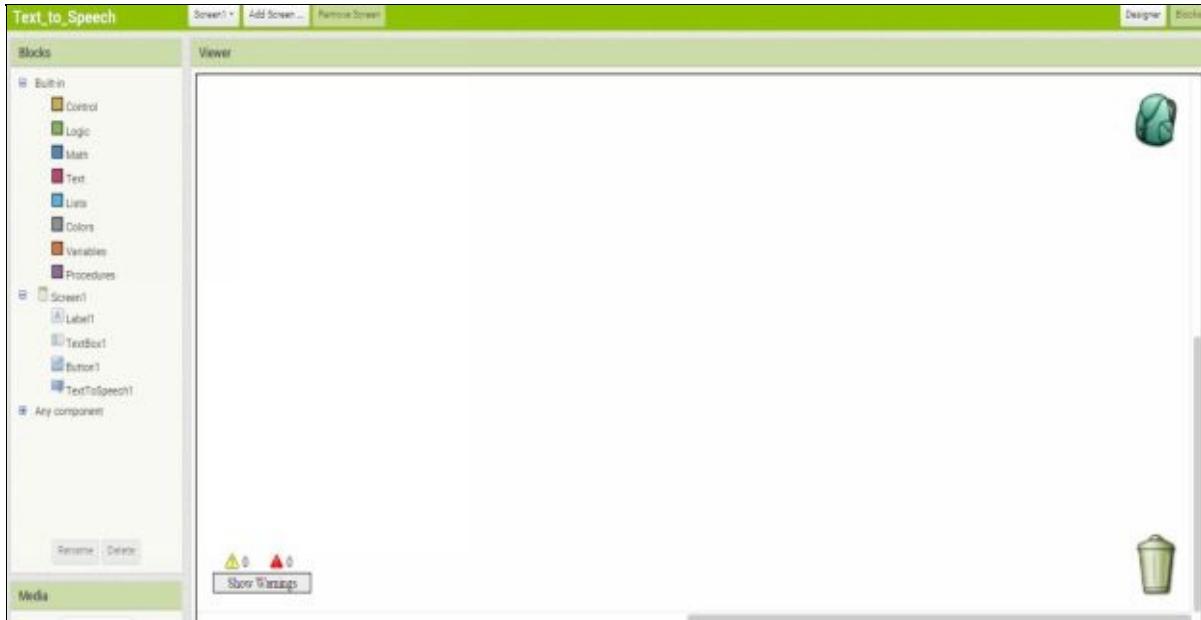

5. Now go to **Media** under **Palette** and Drag **TextToSpeech** component to **Screen1**.It is a **Non-visible component** so it will be shown below screen as **Non-visible component**.

6. Now click on **Blocks** button on top right side to create logic for your app.

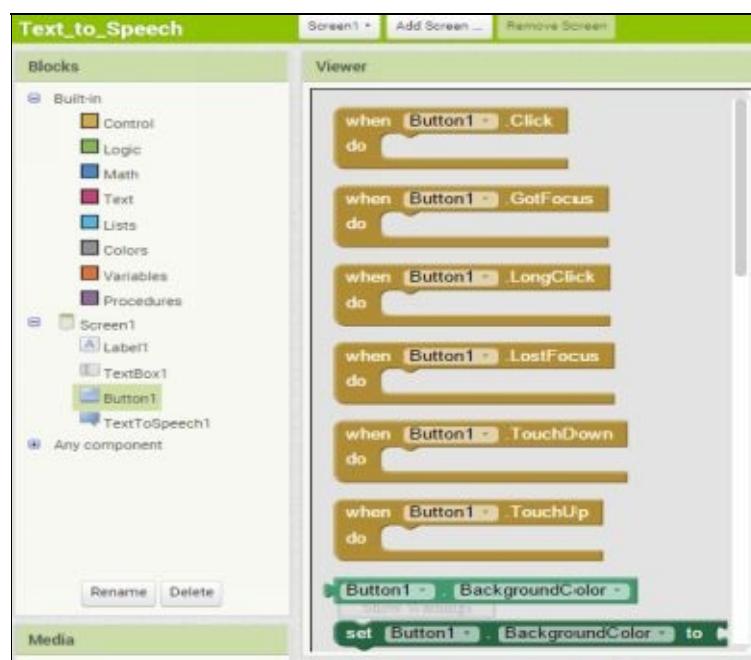

7. You will be landed to below screen. This is [Block editor](#).

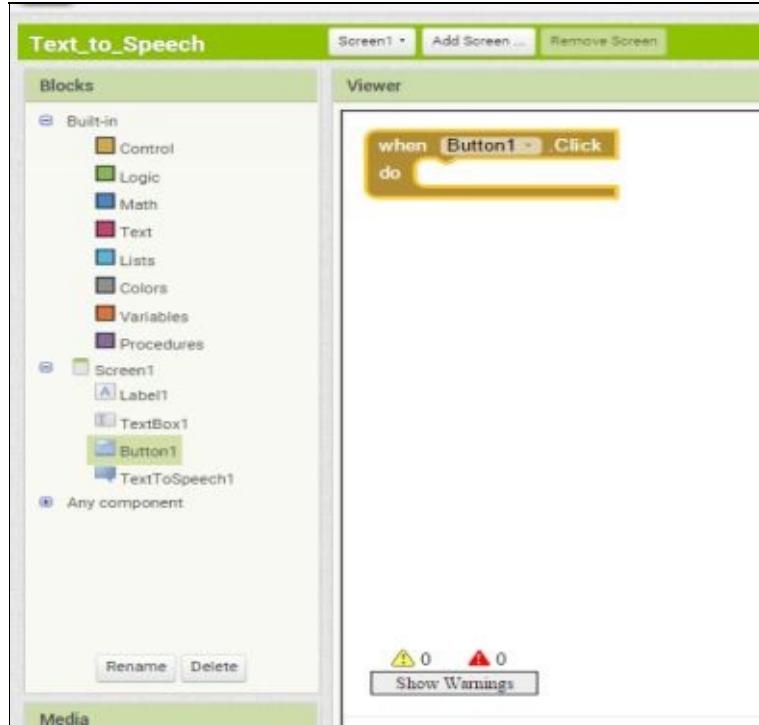

8. Click on [Button1](#) on left side you will see a number of associated [blocks](#) with this

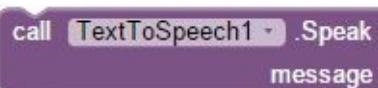

component. Click on [when Button1 .Click](#) block. This is an event block which will decide what your app will do when this button will be clicked. Here click is an event for Button1 component.

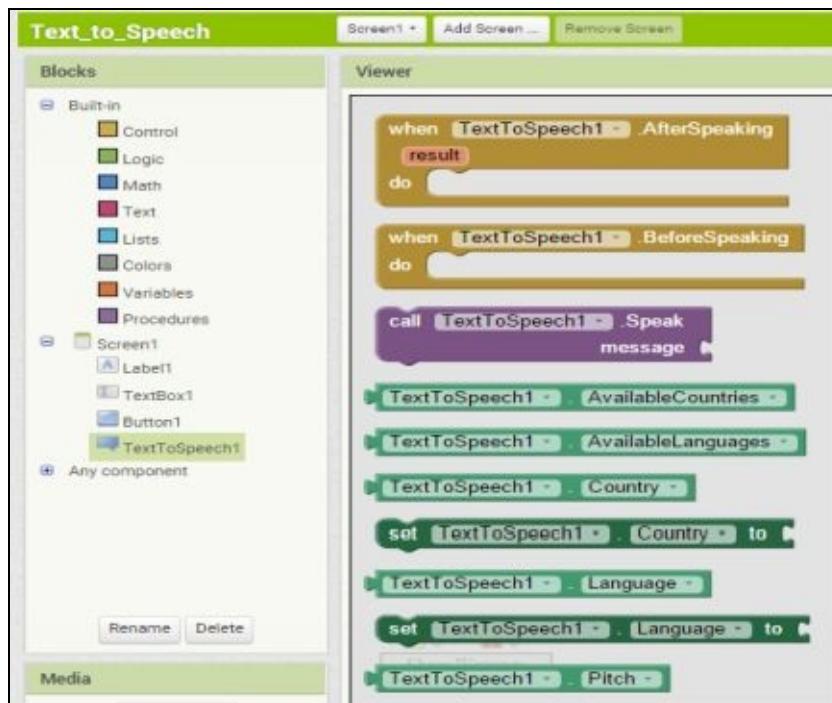

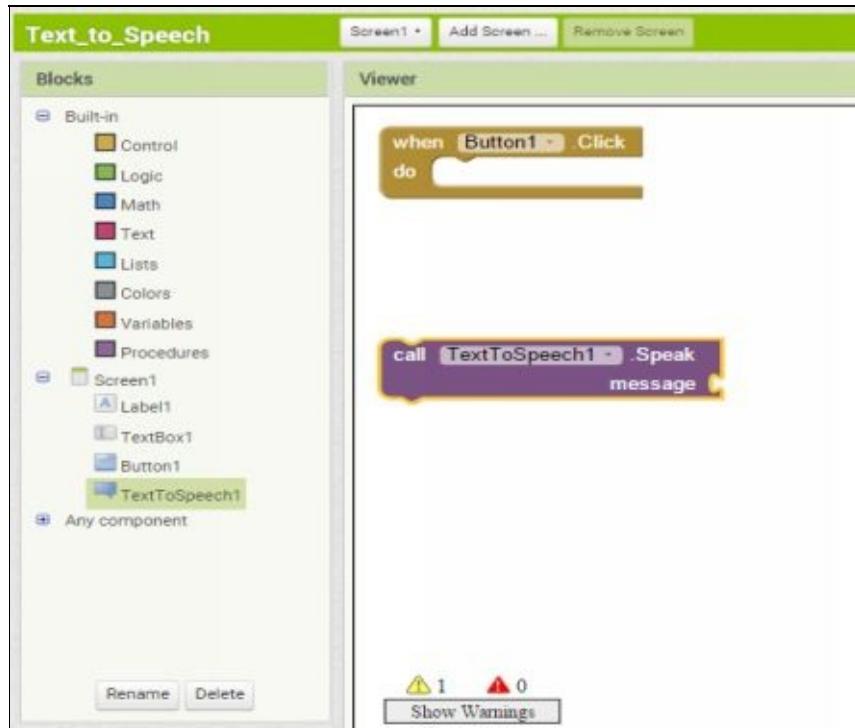

10. Click on **TextToSpeech1** component on left hand side. You will see a number of

associated **blocks** with this component. Click on **TextToSpeech1** block. This block will speak some message which will be attached to this block later.

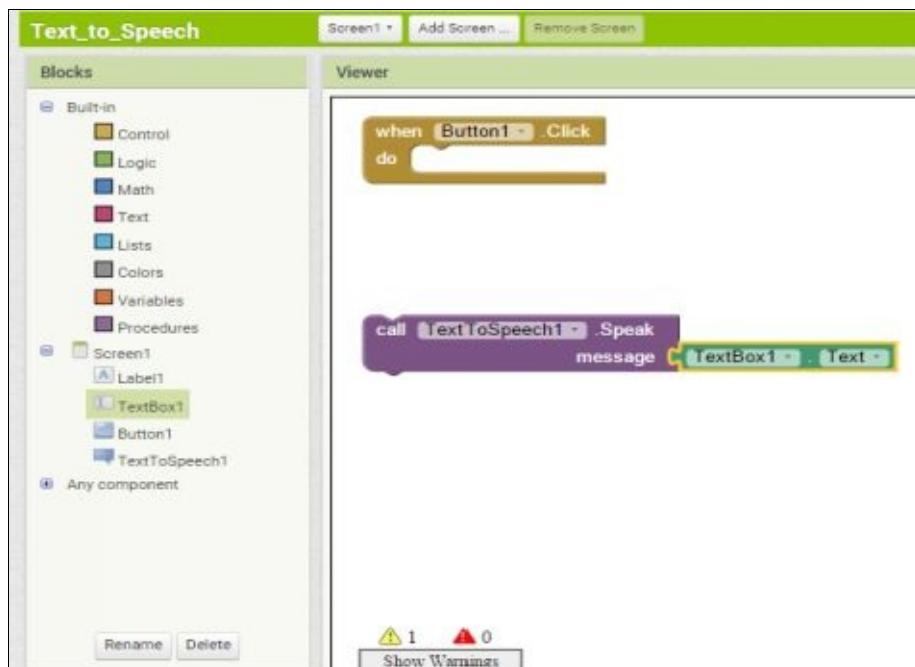

11. Now click on [TextBox1](#) on left hand side. You will see all the associated [blocks](#) with this component. Scroll down and find block. This block contains the text (Message) which is entered in TextBox1.

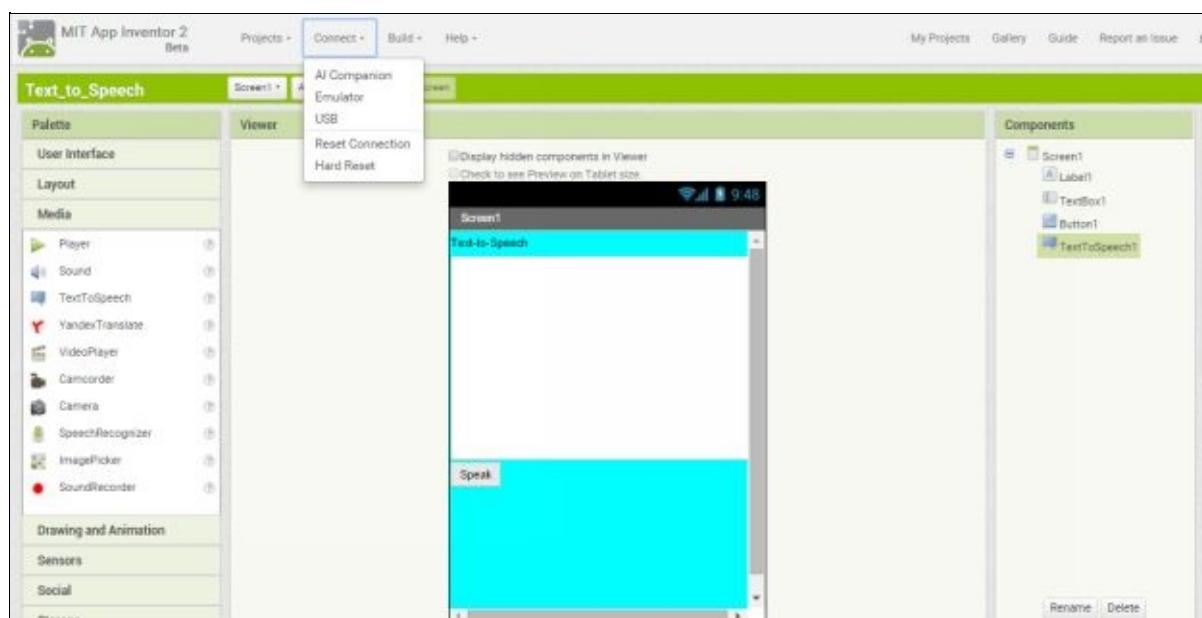

12. Now click on block and drag it to connect to as shown below. This will tell our app to speak the text which is there in TextBox1.

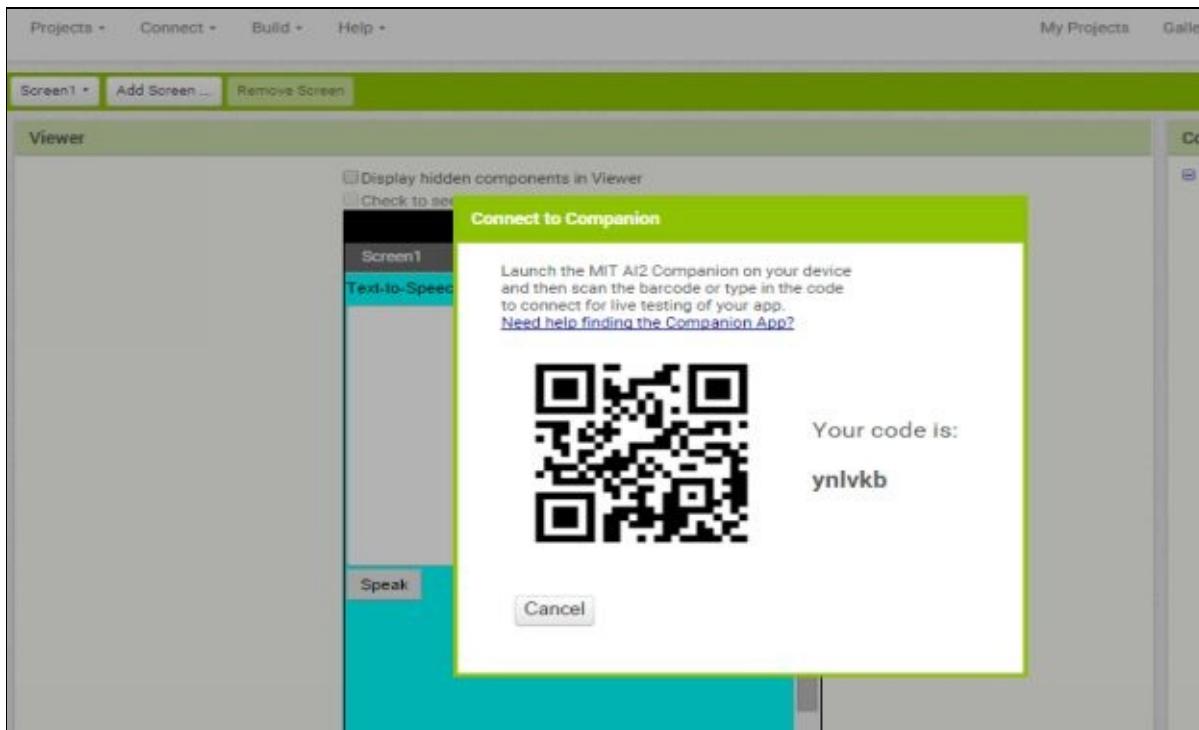

Now connect both the blocks to block. So that when Button1 is clicked your app will speak the text/message which is entered in TextBox1.

13. Now go to Designer and Change Screen1 Title to Text-to-Speech and click on Connect and select AI Companion.

14. You will see something like this.

15. Now open MIT App Inventor 2 Companion in your mobile/Tablet.

And enter the code or scan the [QR code](#) from your mobile and click on [connect with code](#).

Note:-Your Mobile/Tablet should be connected to same wi-fi /network to which your computer/Laptop is connected.

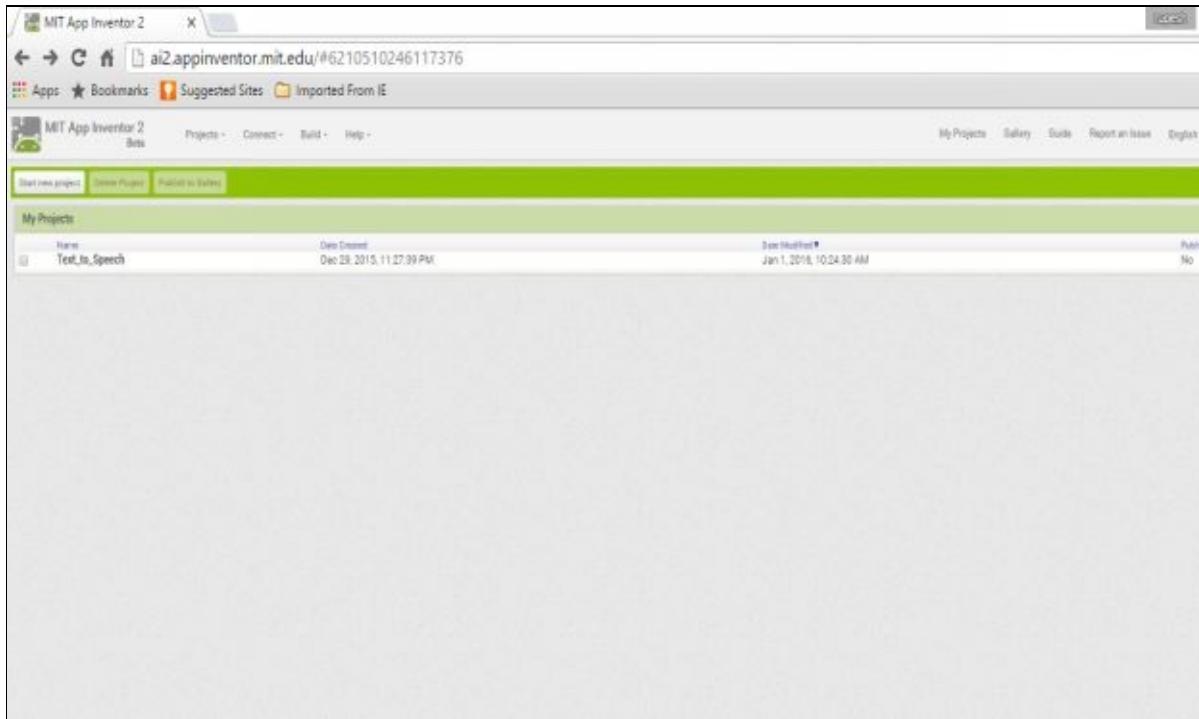

16. Now you should see your app in your phone for live testing. Type Any Text in the [TextBox](#) and Press [Speak](#) Button. Your Mobile should speak the text that you have typed in the [TextBox](#).

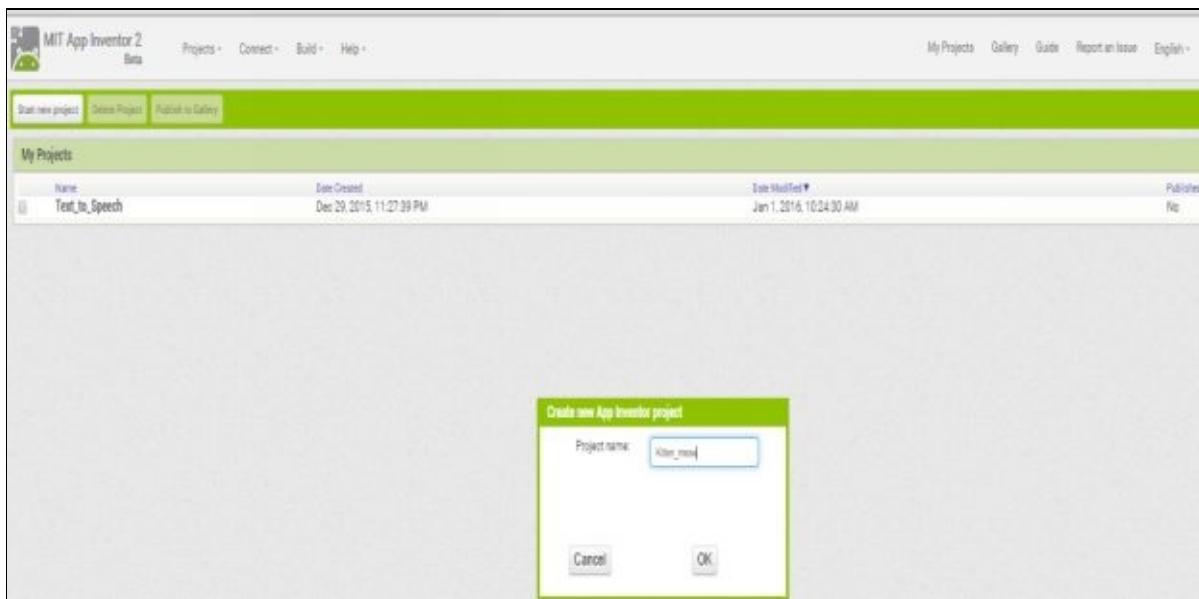

Congratulations you have made your first app.

## Chapter 3: Kitten Meow App

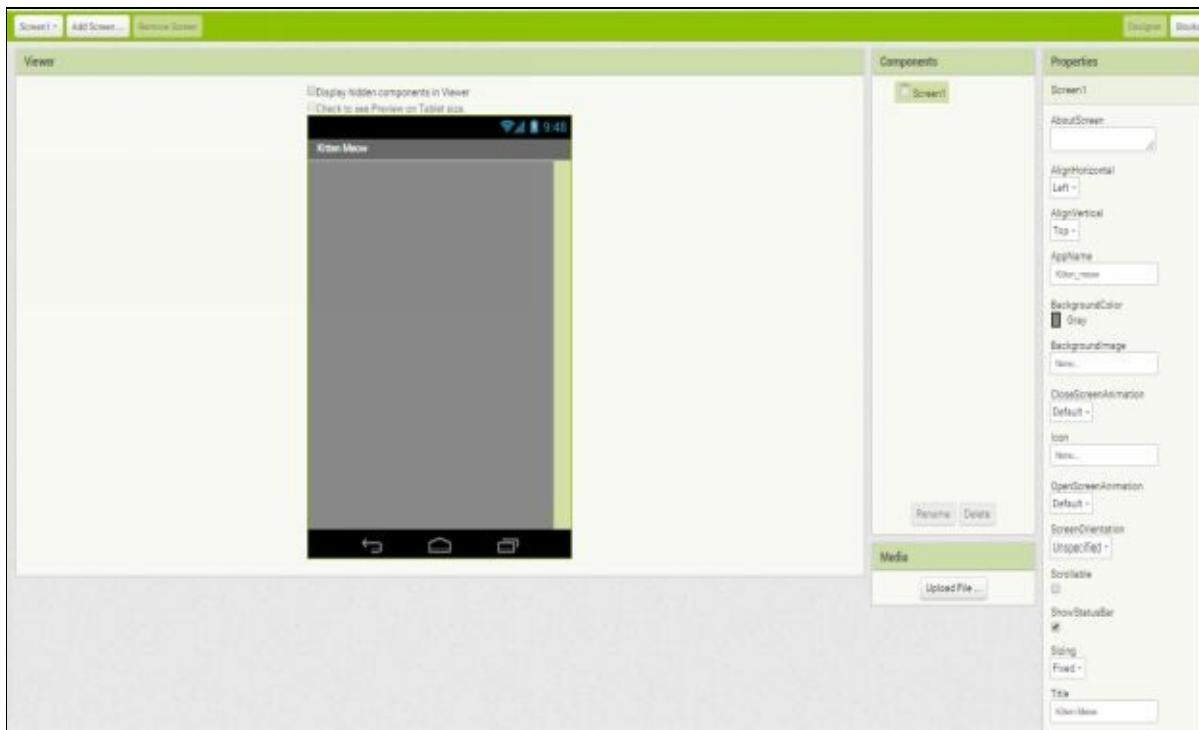

1. Login to App Inventor <http://ai2.appinventor.mit.edu/> .

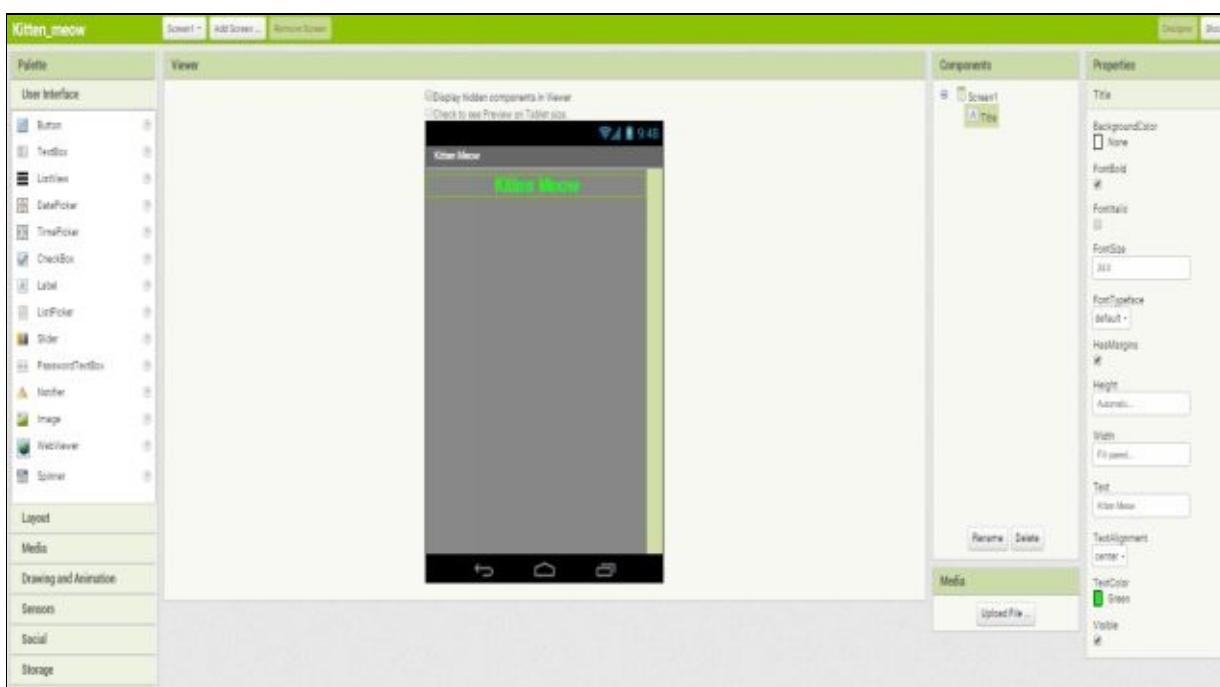

2. Click on **Start new project** and give it name **Kitten\_meow** and click **OK**.

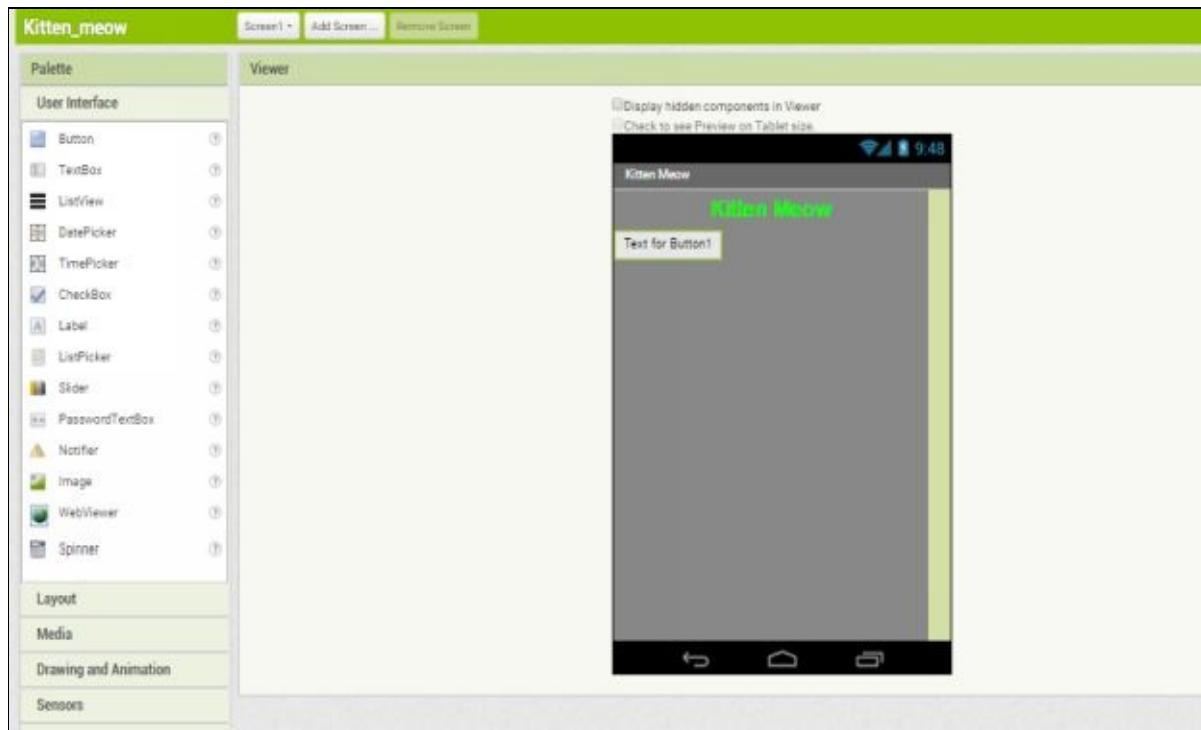

3. Change **Screen1 Title** to **Kitten Meow** and **BackgroundColor** to **Grey** color.

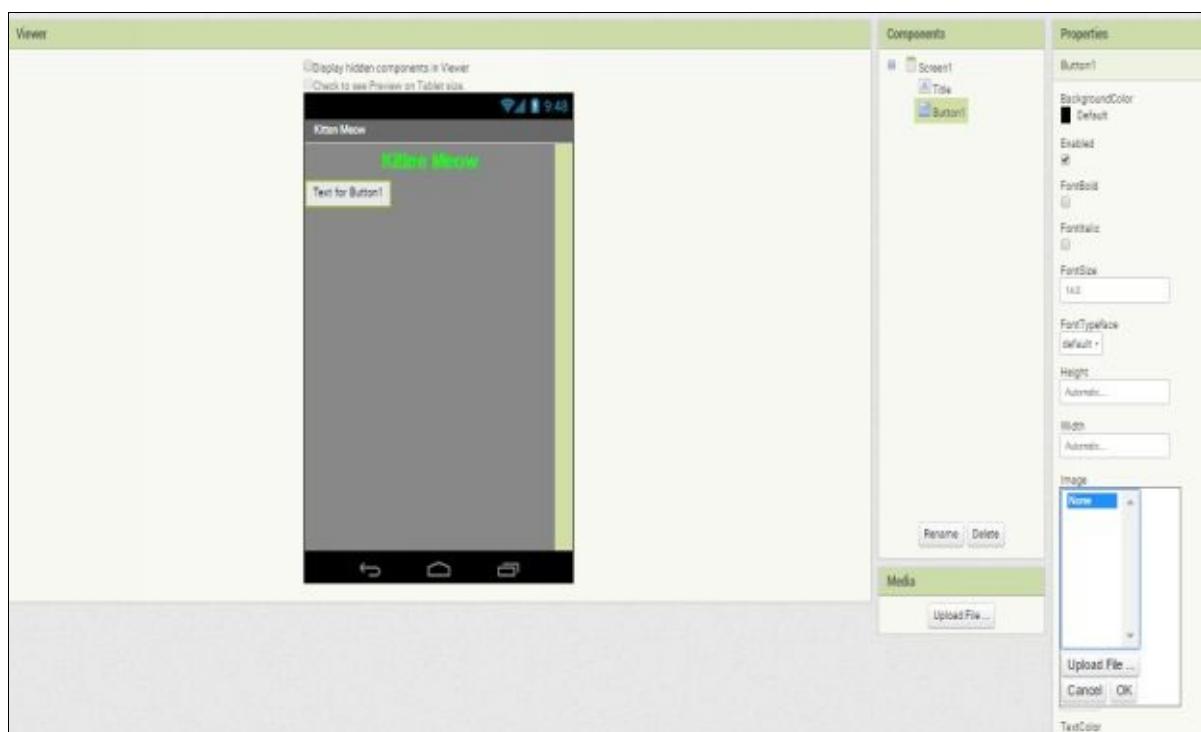

4. Drag a **Label** from **Palette** to **Viewer** screen and change its **Text** and **other properties** as shown below

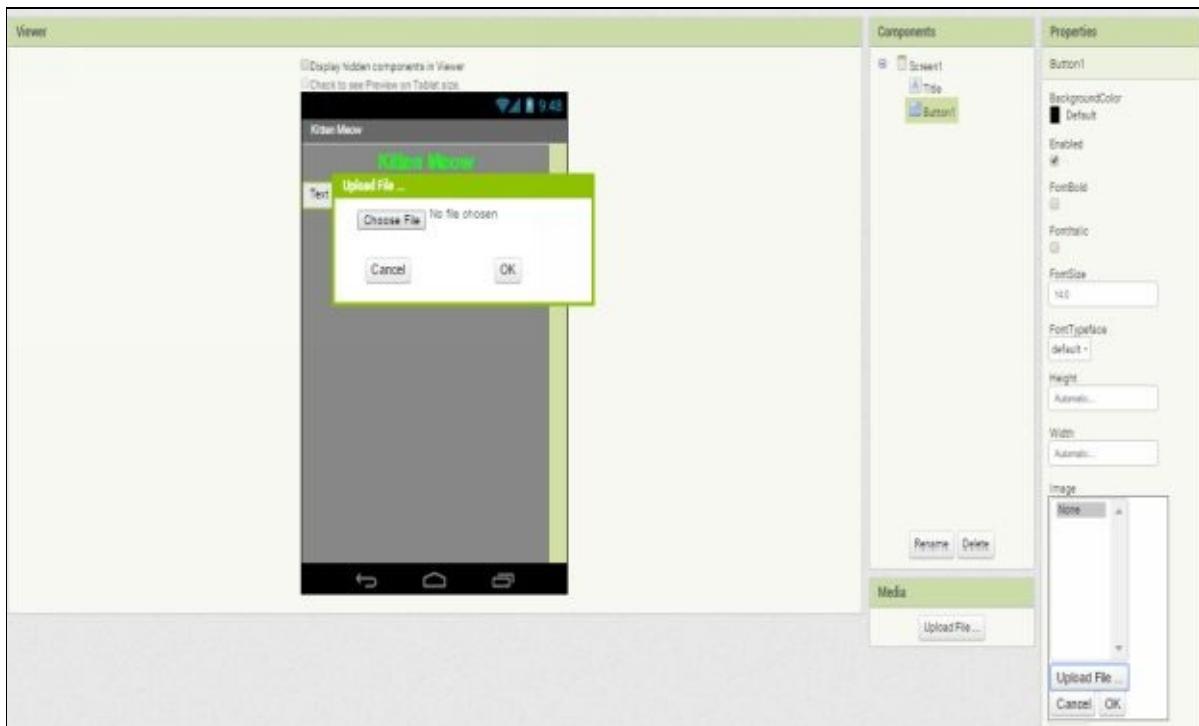

5. Now drag a **Button** from **Palette** to **Viewer** screen.

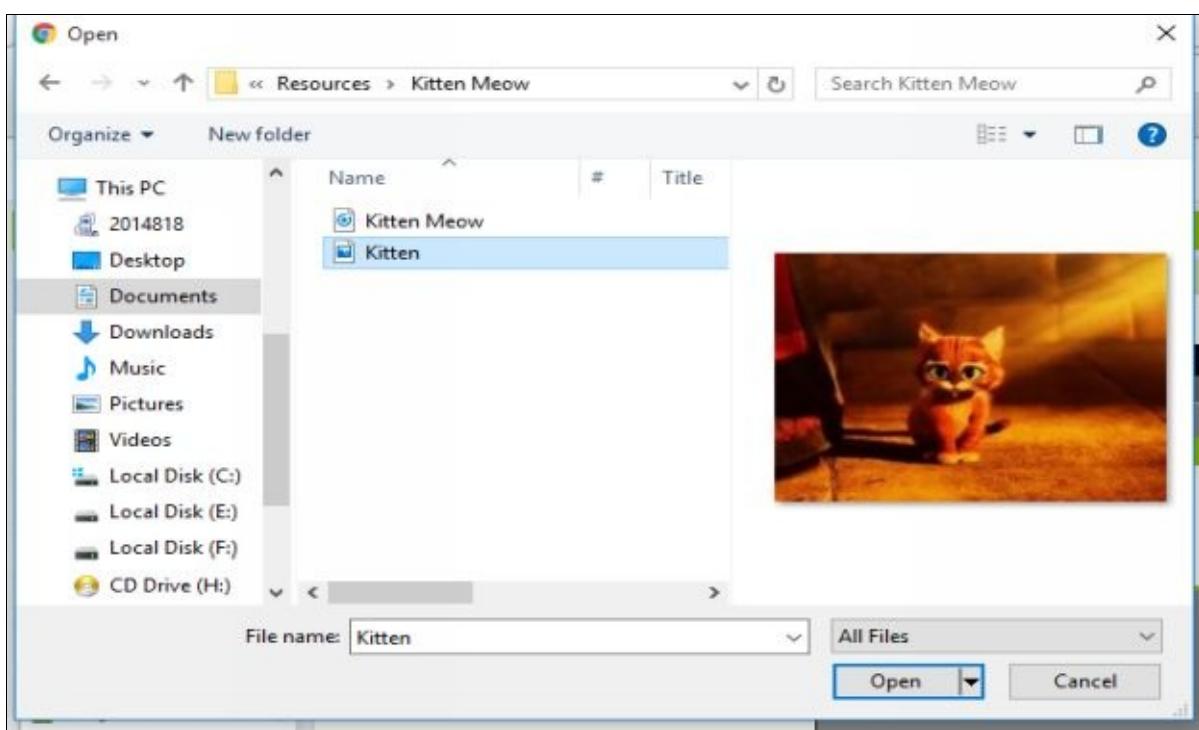

## 6. Now change Button Image to Kitten.jpg under Properties.

Click on [Upload file](#).

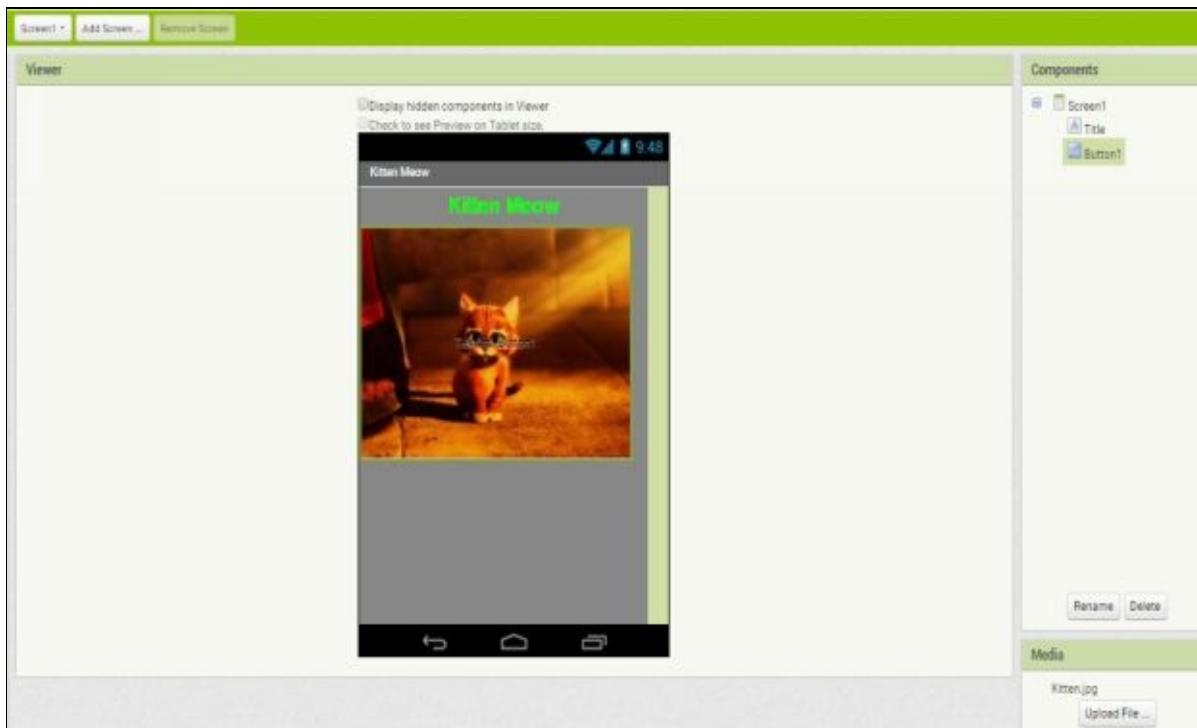

Click on **Choose File** and select **Kitten.jpg** image and click **Open**.

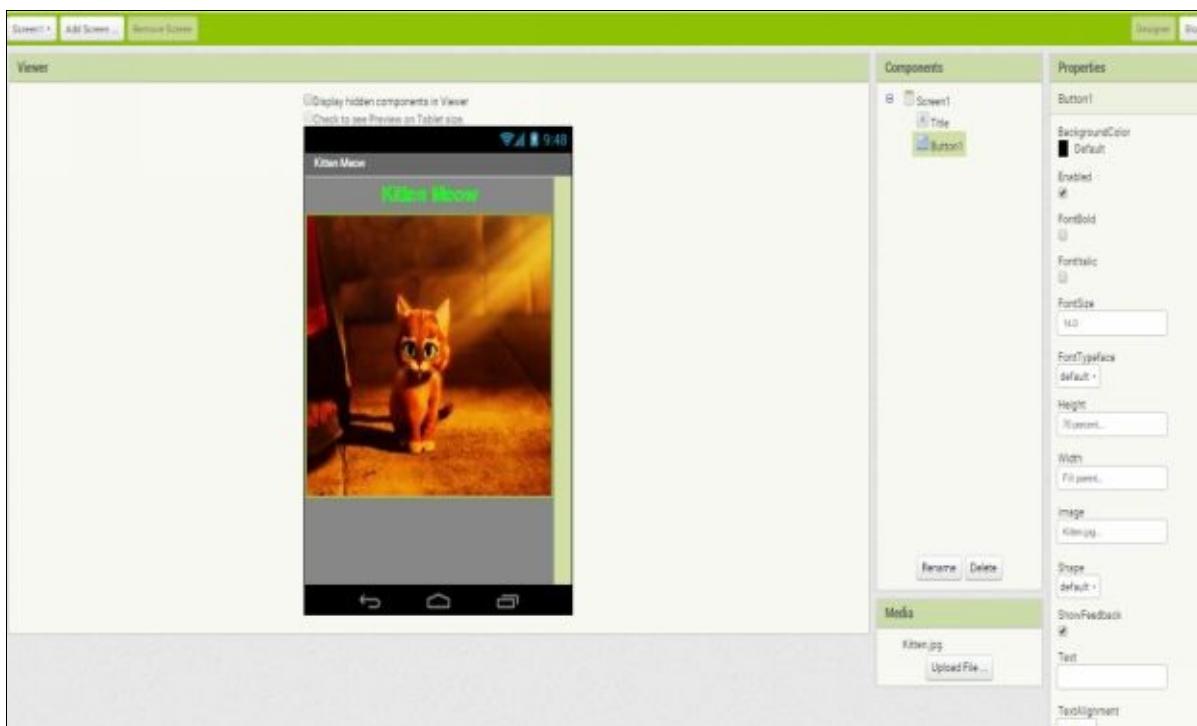

Click **OK**.

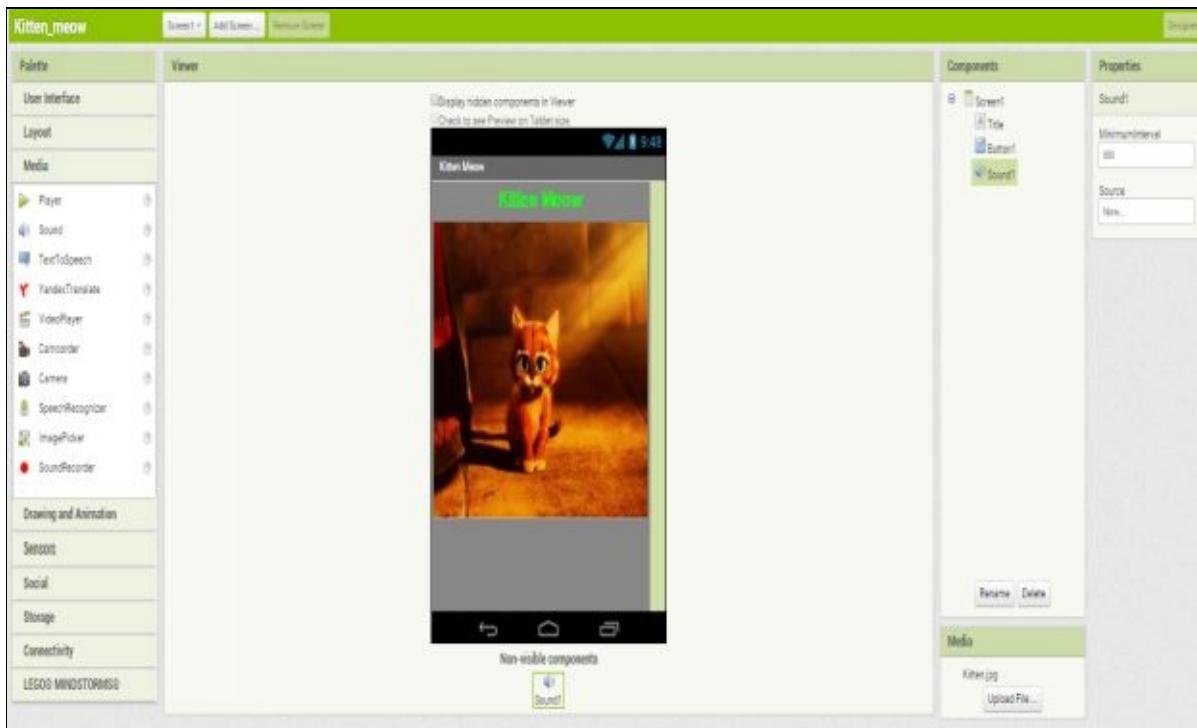

7. Now **Image** will be shown in your **viewer** screen.

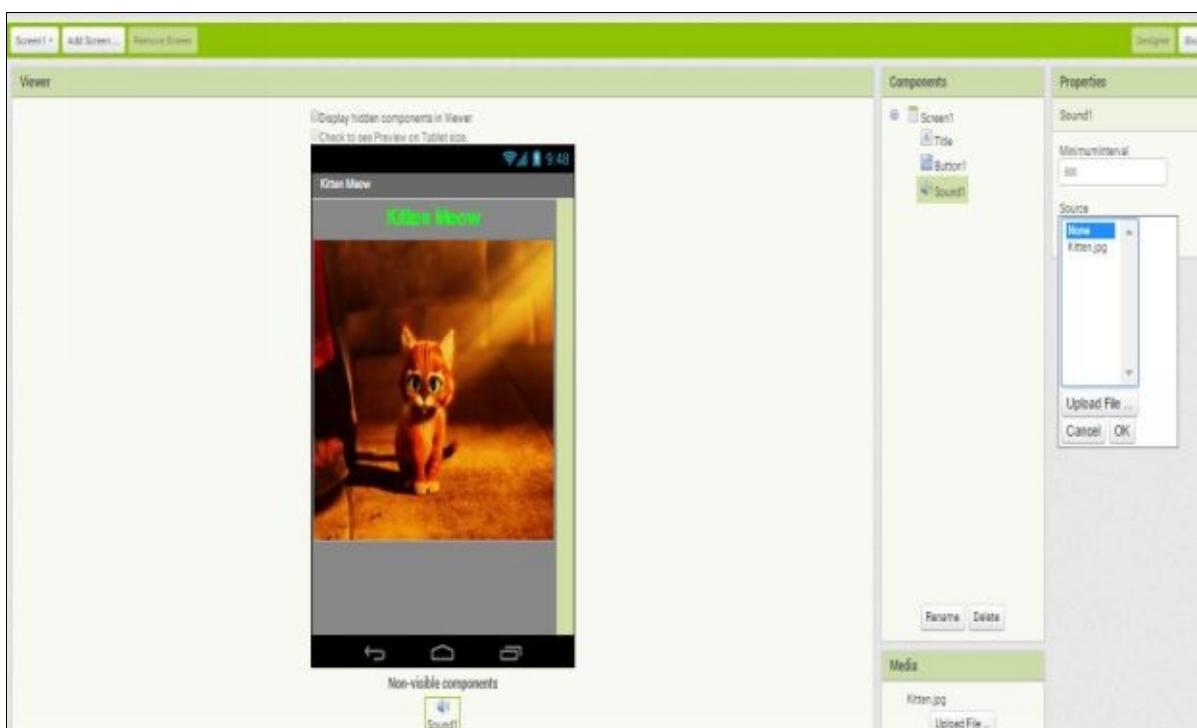

8. Delete Button1 Text under Button1 Properties and set Button1 width to Fill parent and Button1 Height to 70 percent.

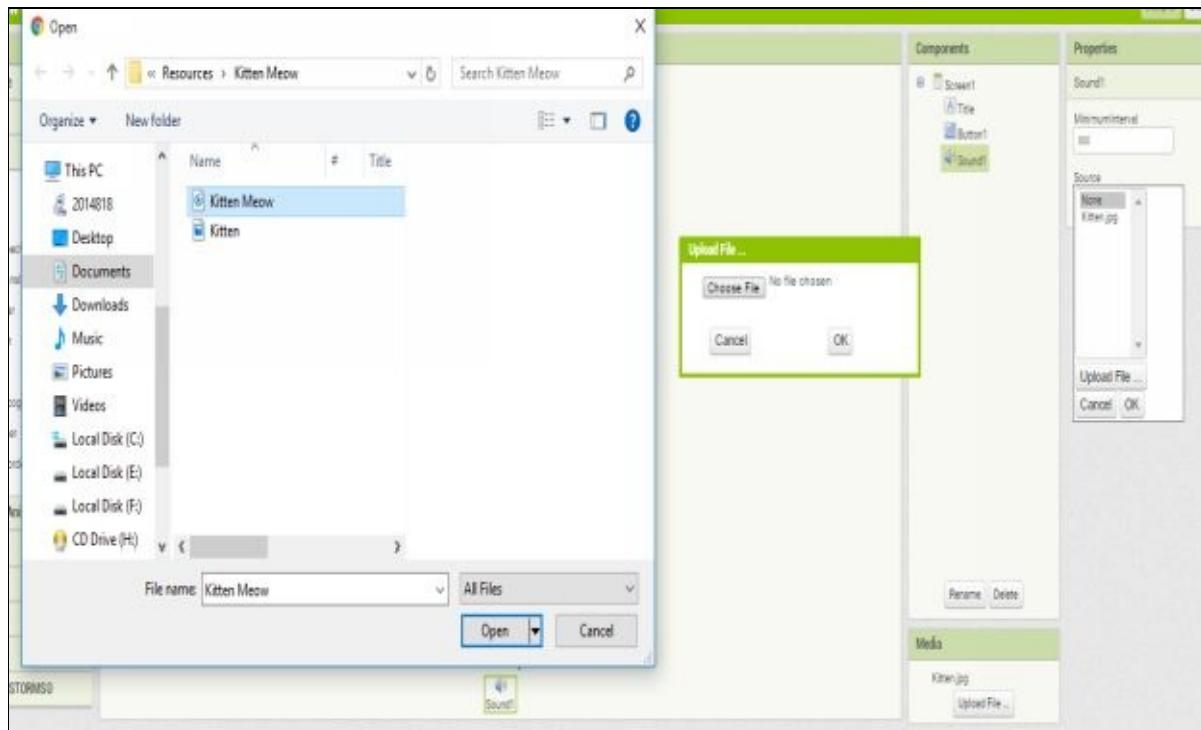

9. Now drag a Sound component from Palette to Viewer.

10. Click on **Source** property of **Sound1** component under **Properties**.

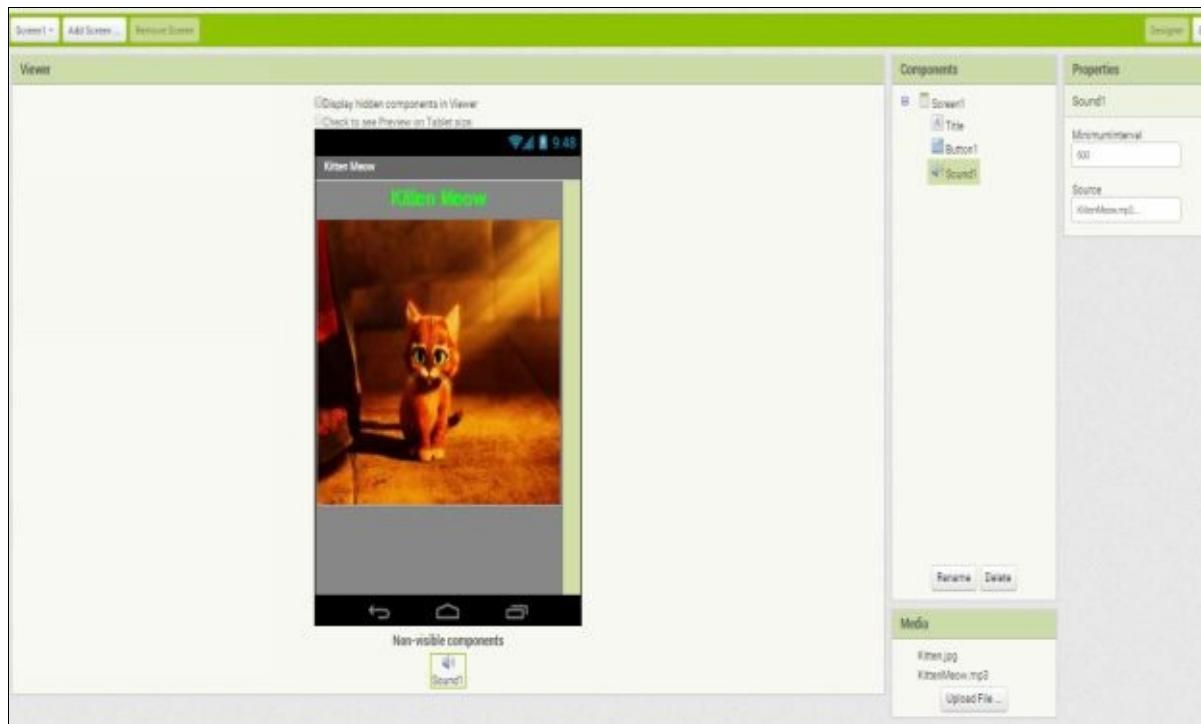

Click on **Upload File** and then click on **Choose File**.

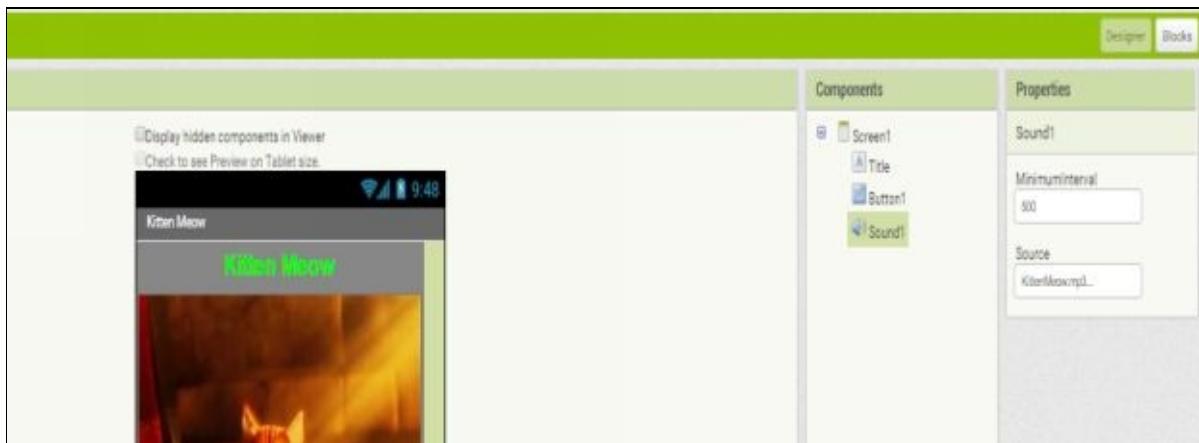

Select **KittenMeow.mp3** File and click **Open**.

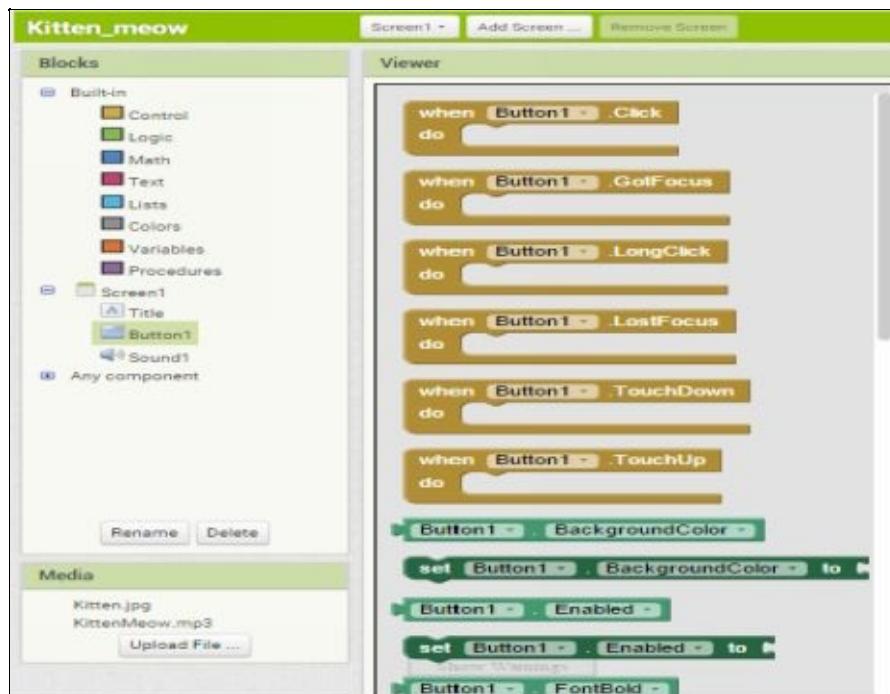

Click **OK**.

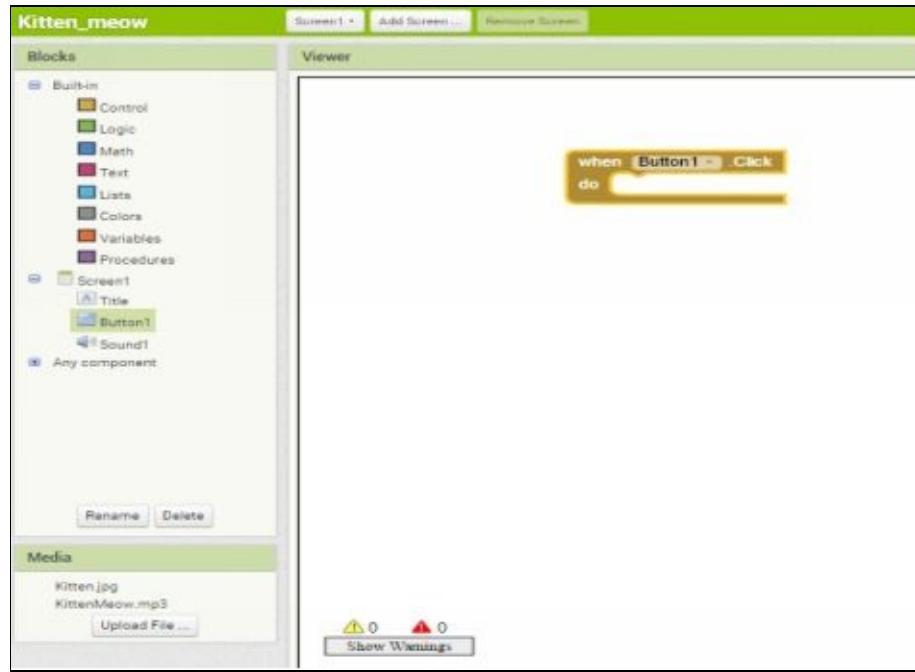

11. Now click on **Blocks**.

12. Now click on **Button1** component on left hand side and choose **block**. This is an event block which will decide what your app will do when this button will be clicked. Here click is an event for Button1 component.

13. Now click on **Sound1** Component and select **call Sound1 .Play** block. This block will play some Sound1's source file(KittenMeow.mp3).

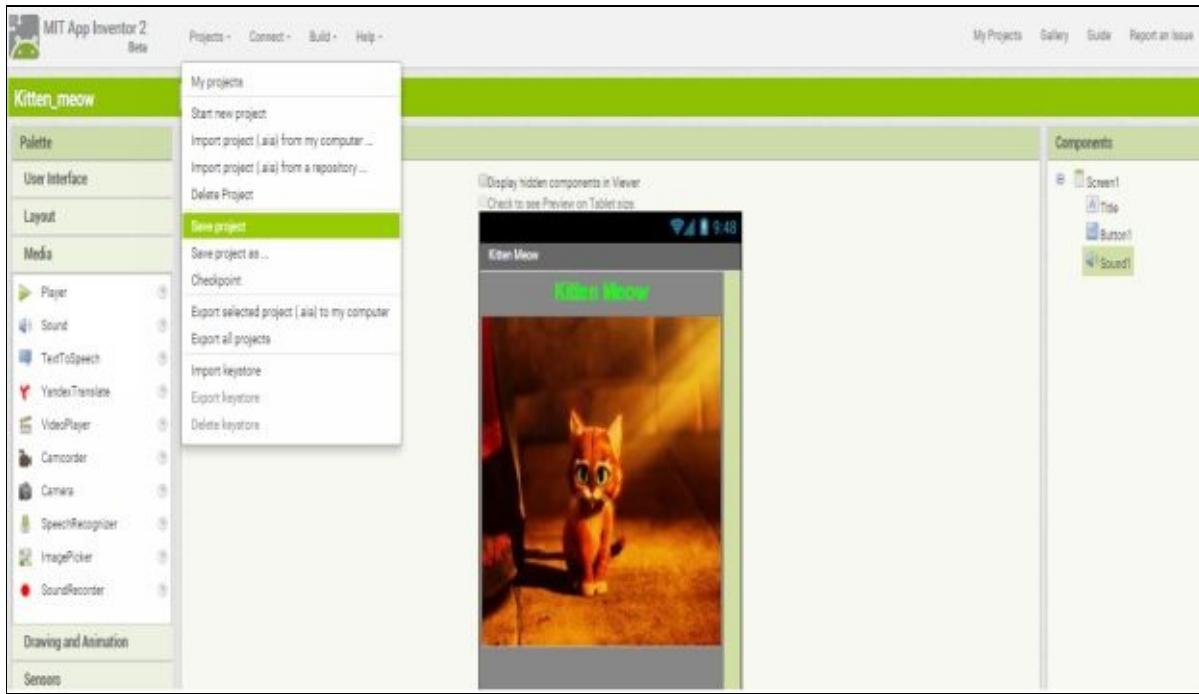

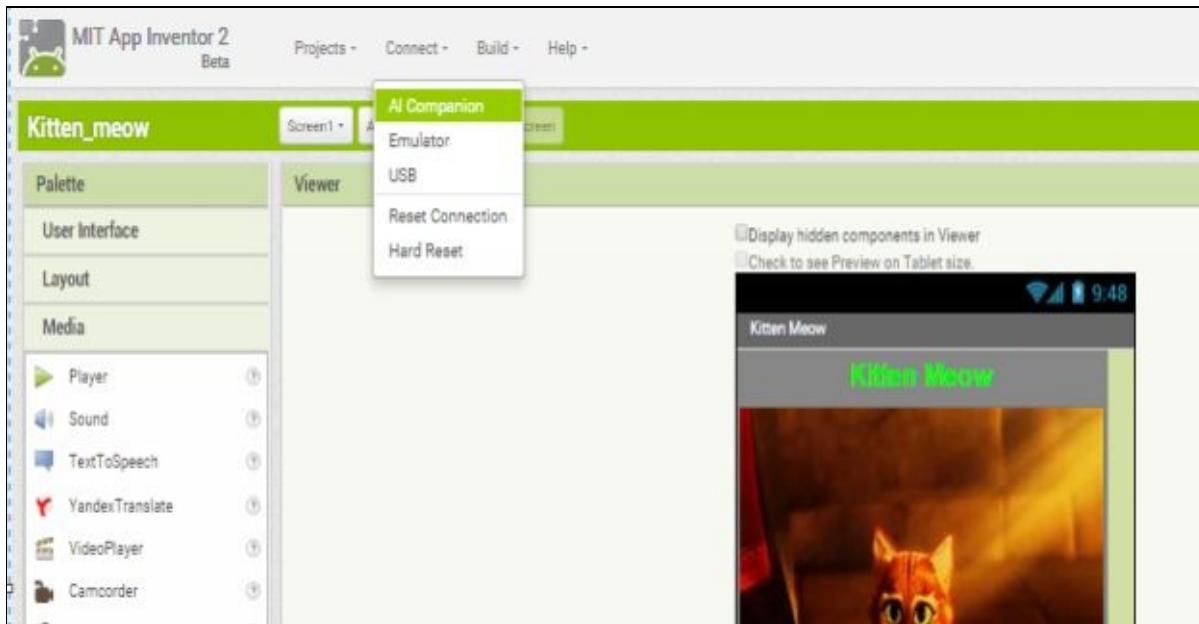

14. Now connect these **blocks** as shown below. This block will tell our app to play KittenMeow.mp3 when Button1 is clicked.

15. Now go to **Designer** and **save** the Project.

16. Now click on **Connect** and select **AI Companion**.

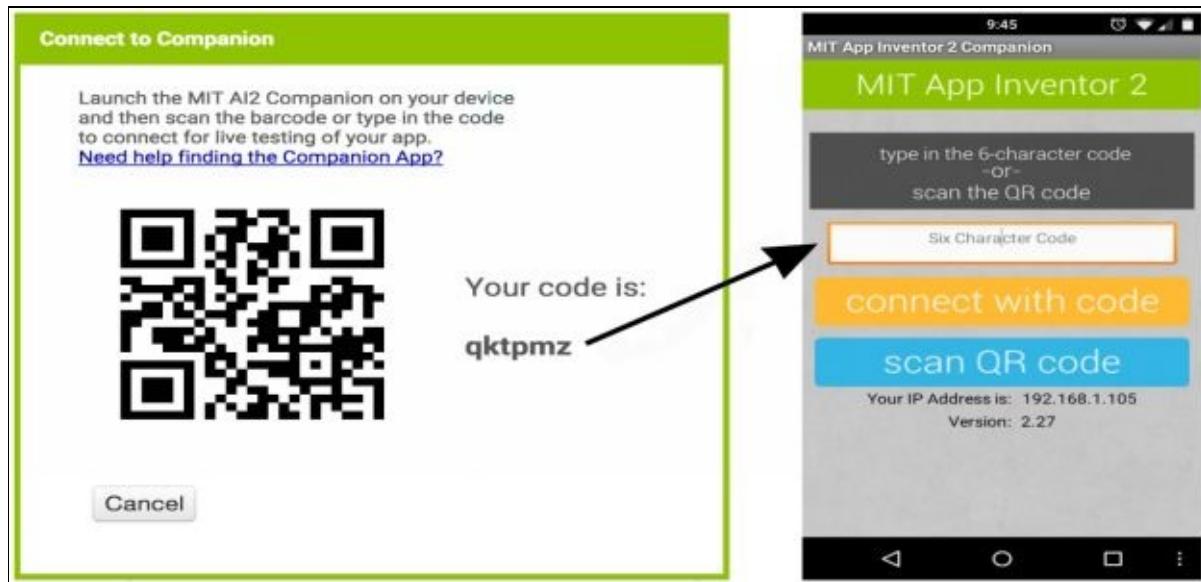

17. Now open MIT App Inventor 2 Companion in your mobile/Tablet.

And enter the code or scan the QR code from your mobile and click on Connect with code.

Note:- Your Mobile/Tablet should be connected to same wi-fi/network to which your computer/Laptop is connected.

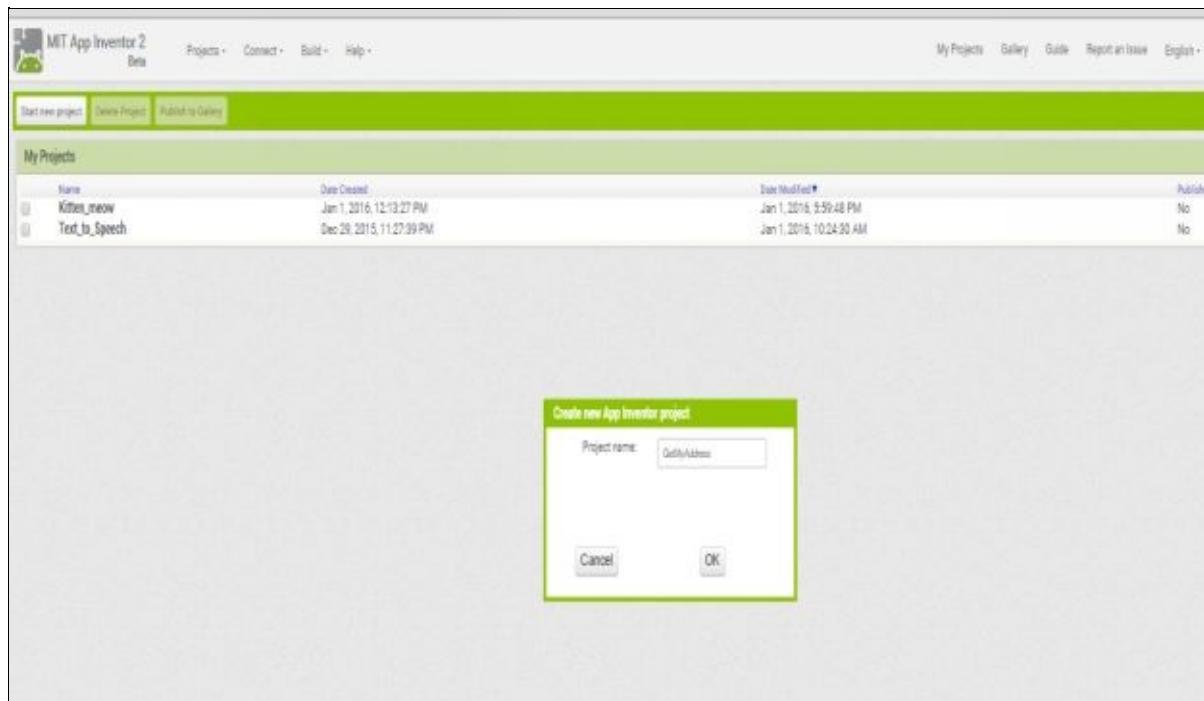

18. Now you should see your app in your phone for live testing. Touch the Kitten and it should play Meow sound.

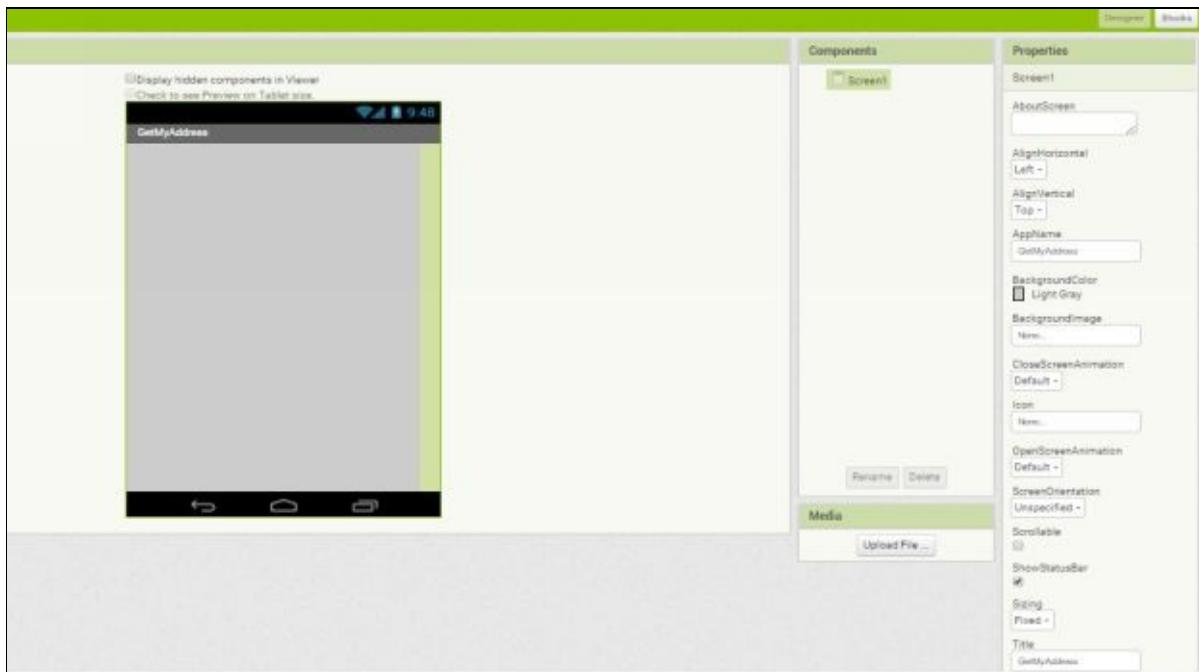

## Chapter 4: GetMyAddress (GPS) App

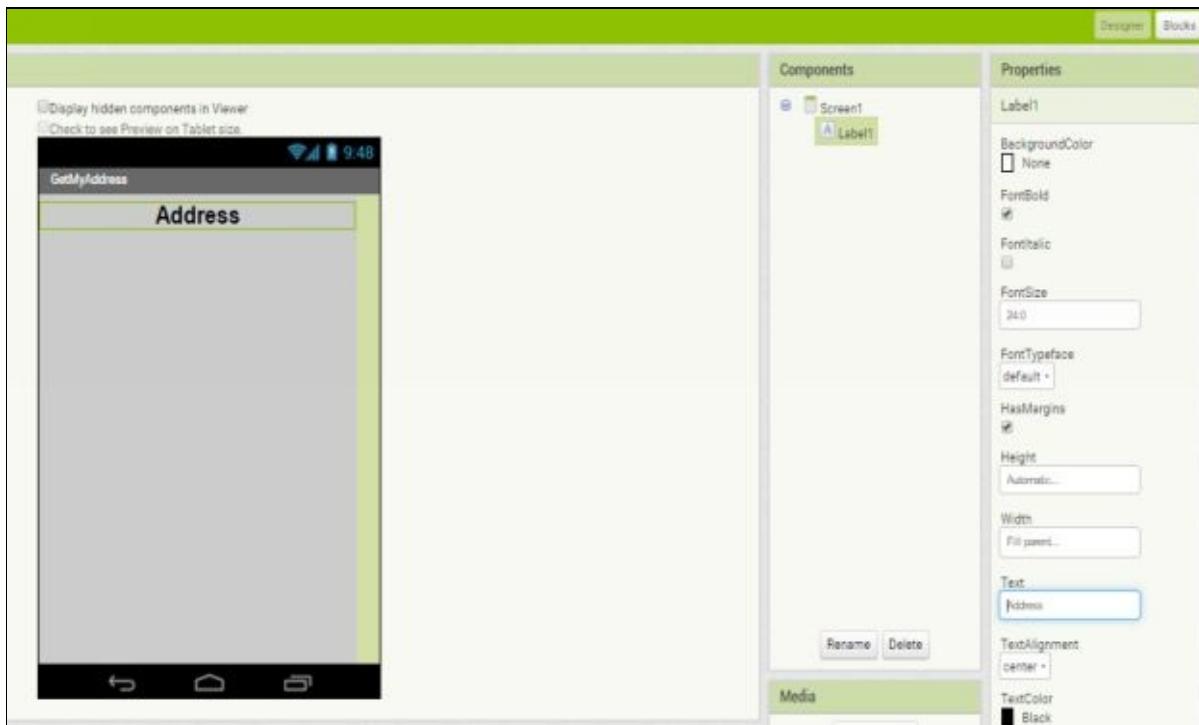

1. Click on **Start new project** and give it name **GetMyAddress** and click **OK**.

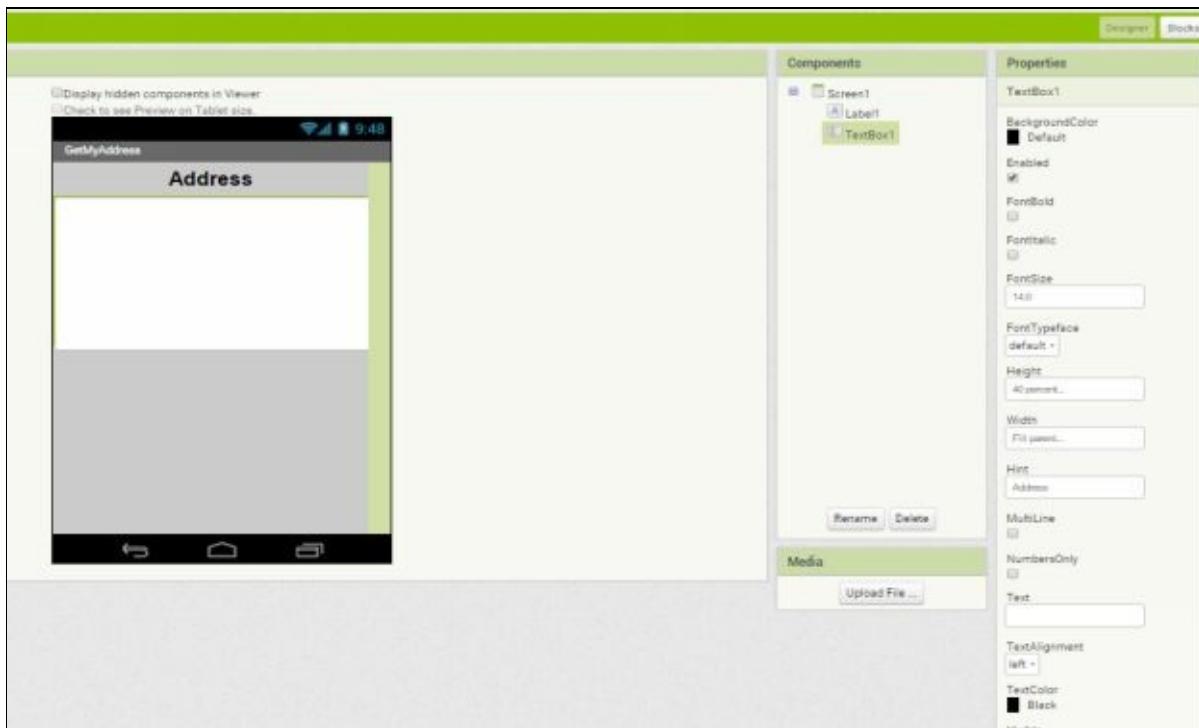

2. Change **Screen1 Text** to **GetMyAddress** and **BackgroundColor** to **LightGray**.

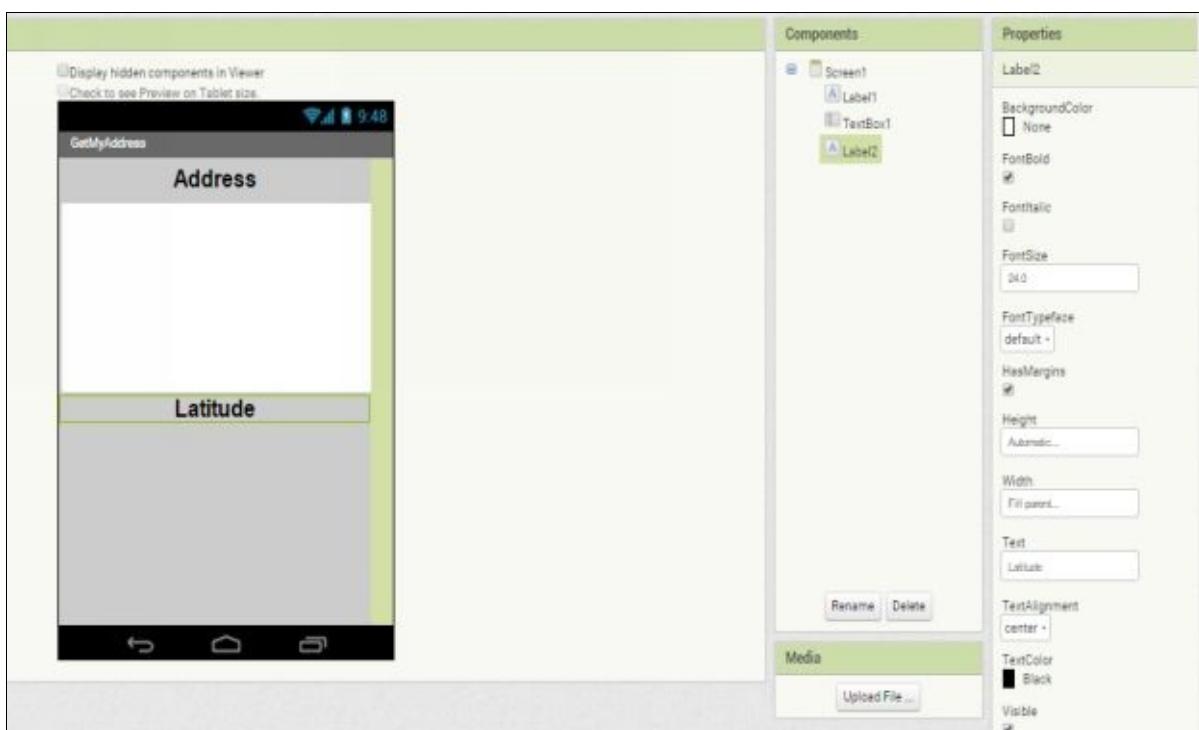

3. Drag a **Label** from **Palette** to **Viewer** screen and set its **Properties** as shown below.

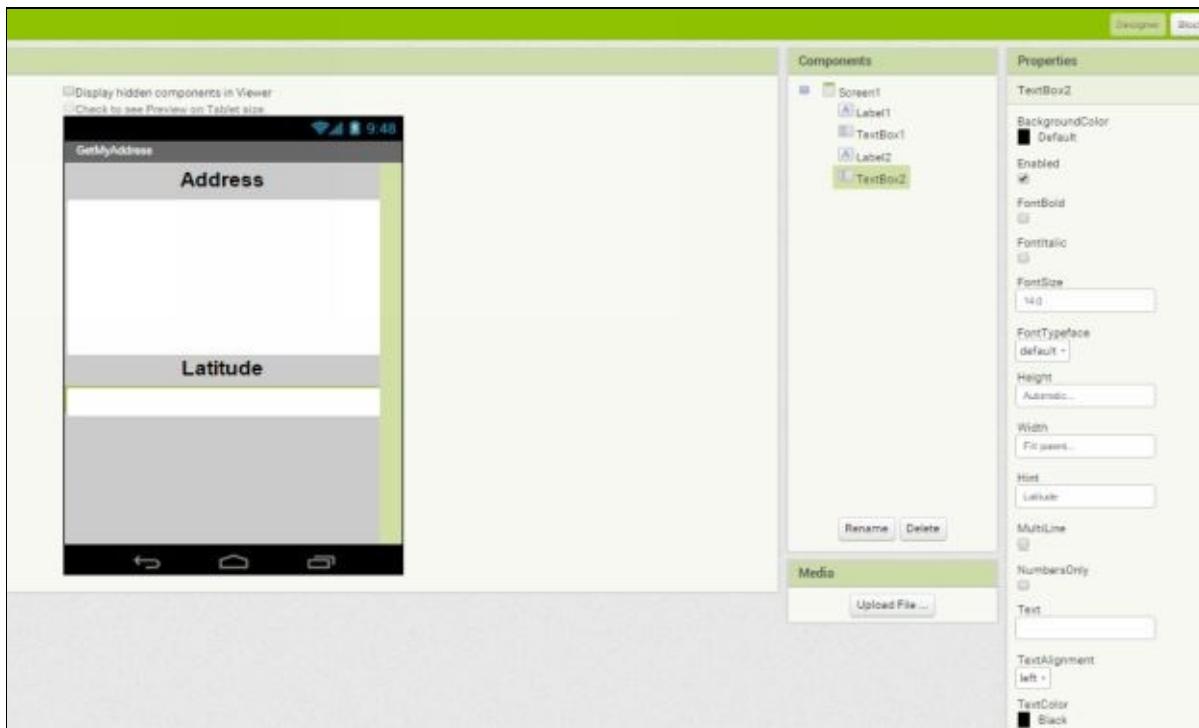

4. Drag a **TextBox** from **Palette** to **Viewer** screen and set its **Properties** as shown below.

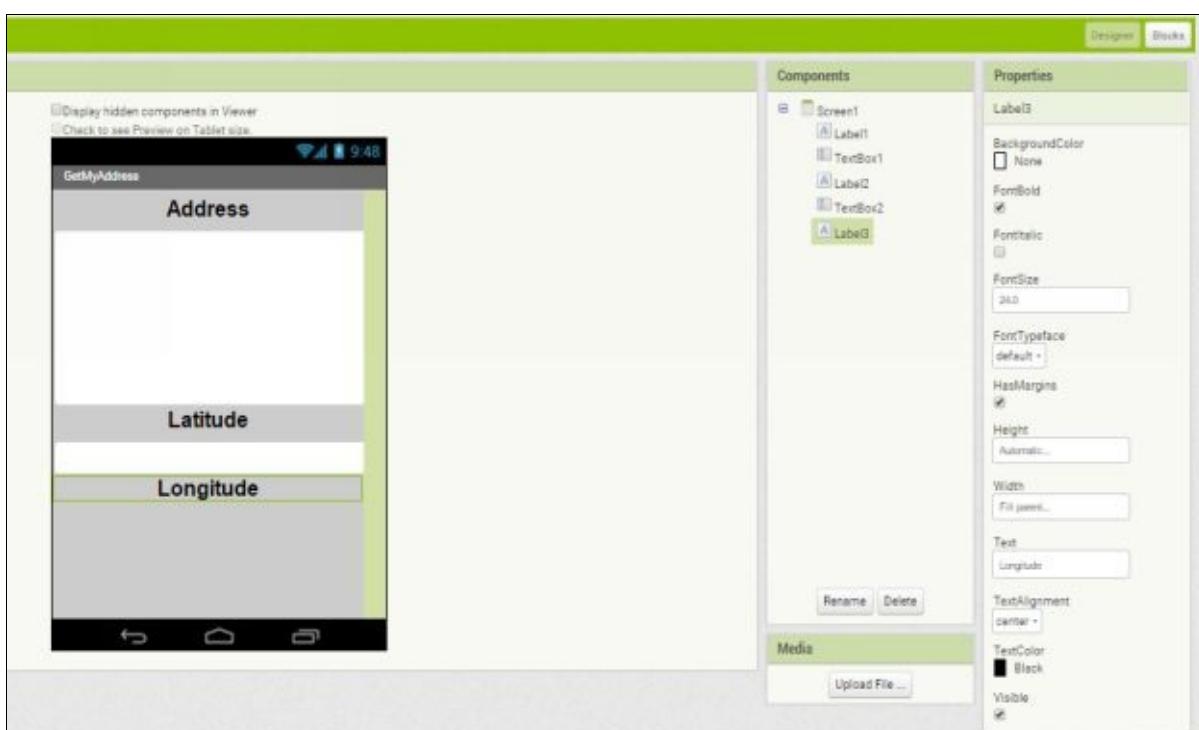

5. Drag another **Label** from **Palette** to **Viewer** screen and set its **Properties** as shown below.

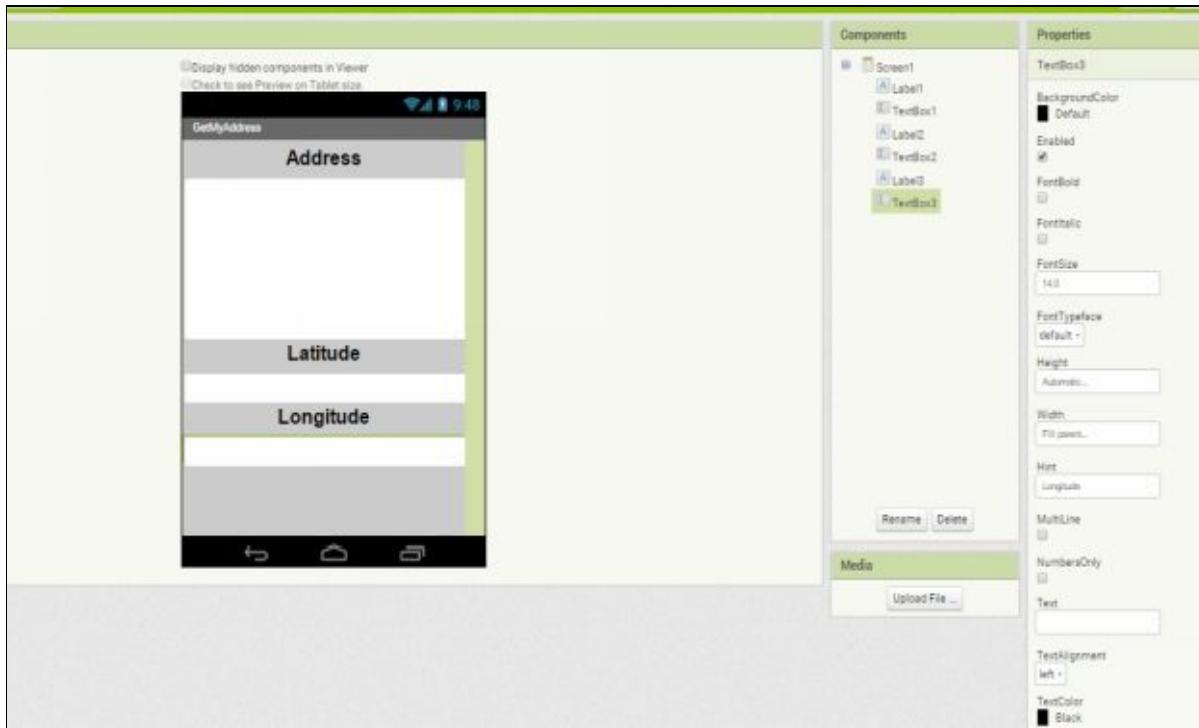

6. Drag another **TextBox** from **Palette** to **Viewer** screen and set its **Properties** as shown below.

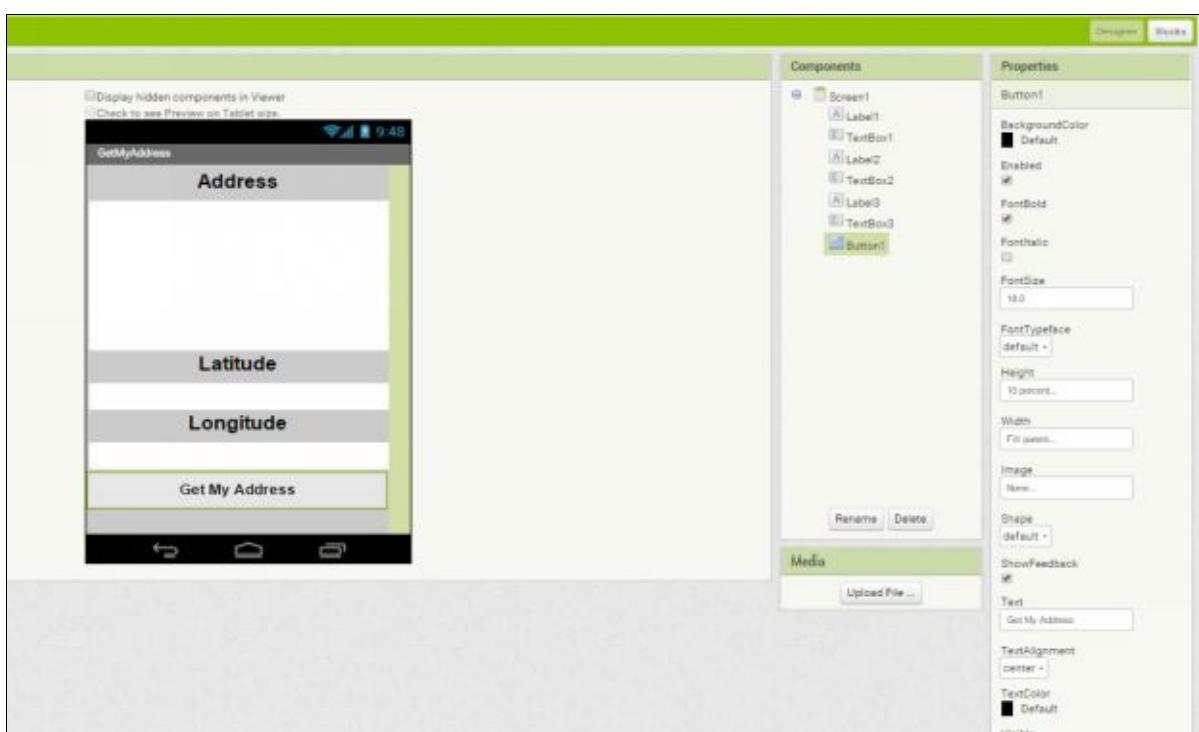

7. Drag another **Label** from **Palette** to **Viewer** screen and set its **Properties** as shown below.

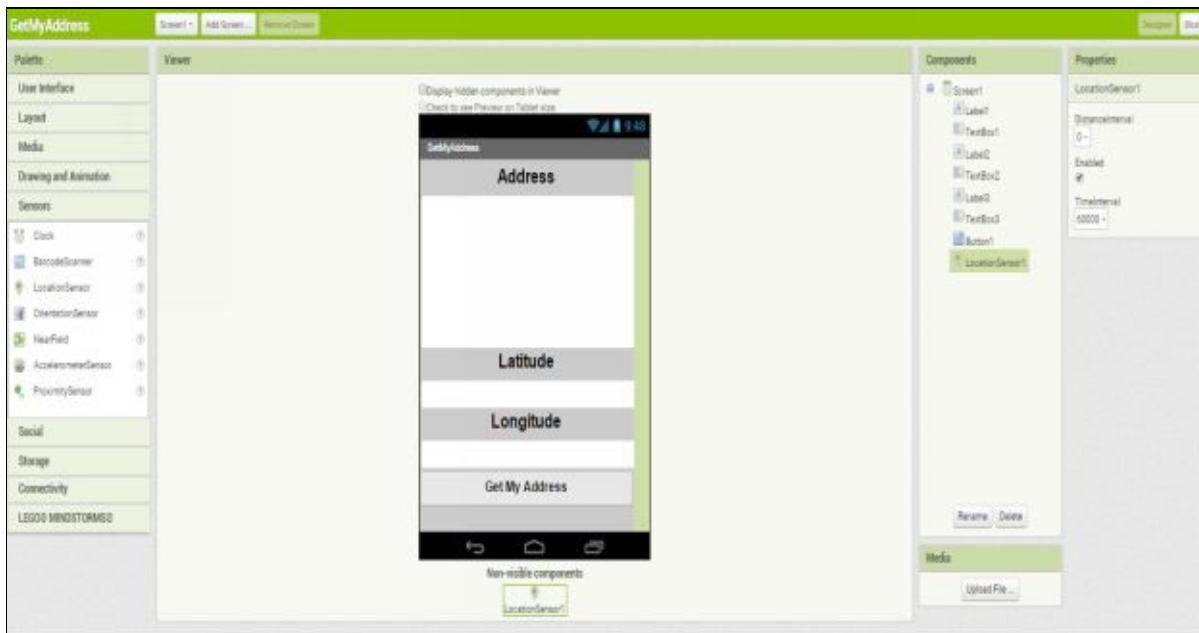

8. Drag another **TextBox** from **Palette** to **Viewer** screen and set its **Properties** as shown below.

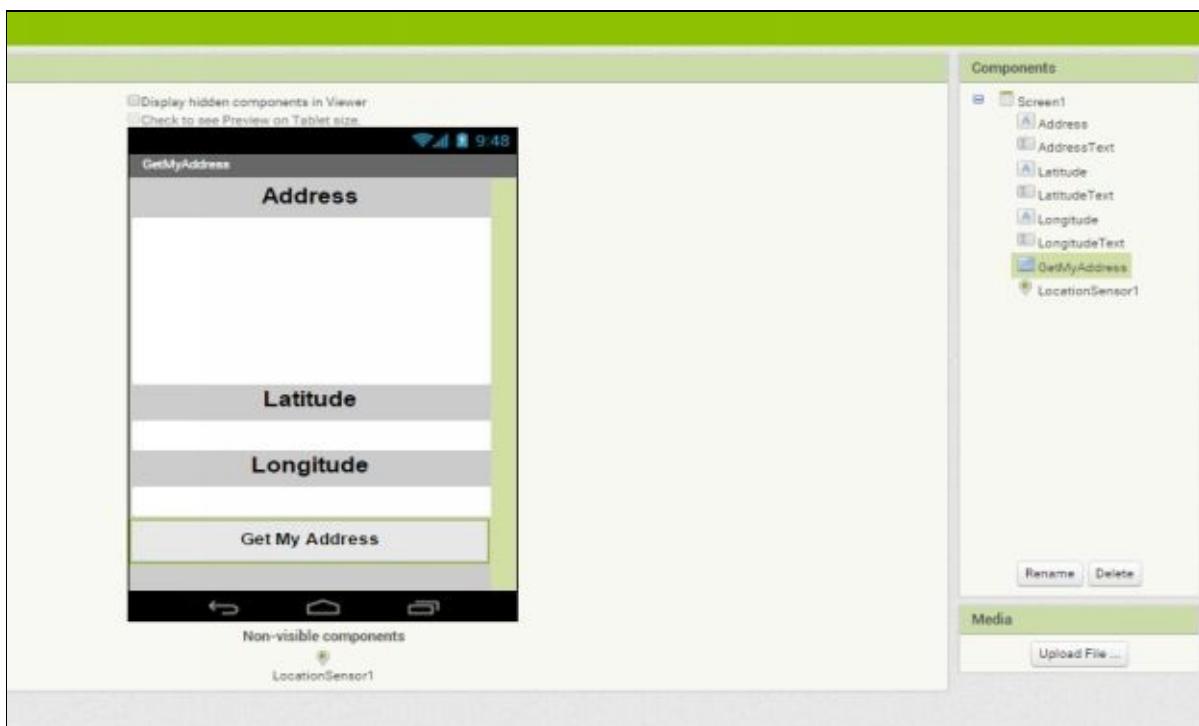

9. Drag a **Button** from **Palette** to **Viewer** screen and set its **Properties** as shown below.

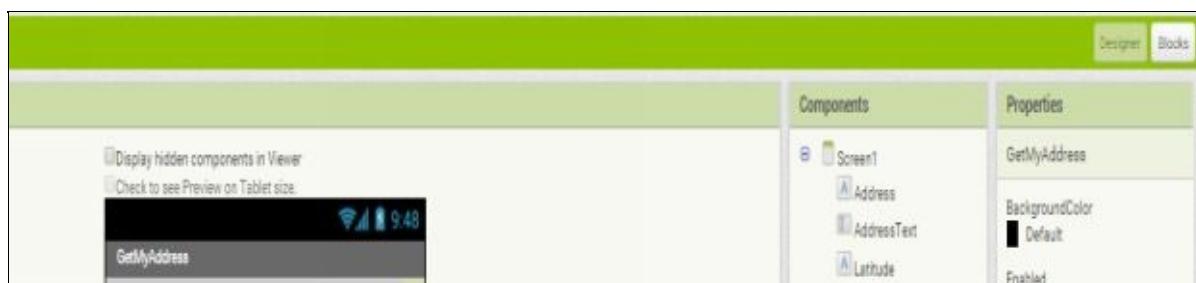

10. Drag **LocationSensor** component from **Palette** to **Viewer** screen.

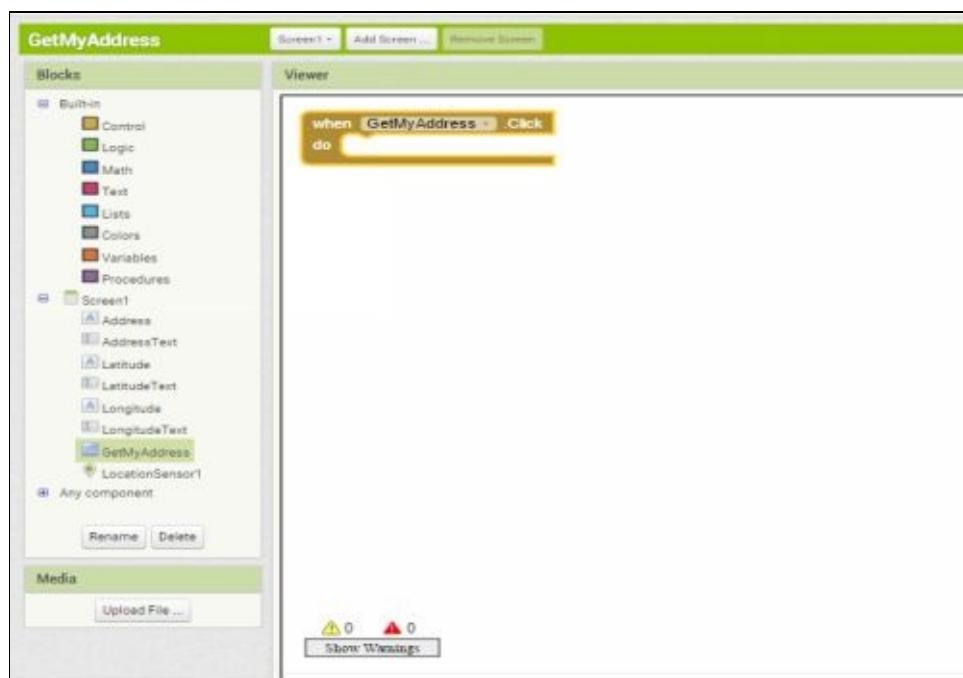

11. Rename the components as shown below.

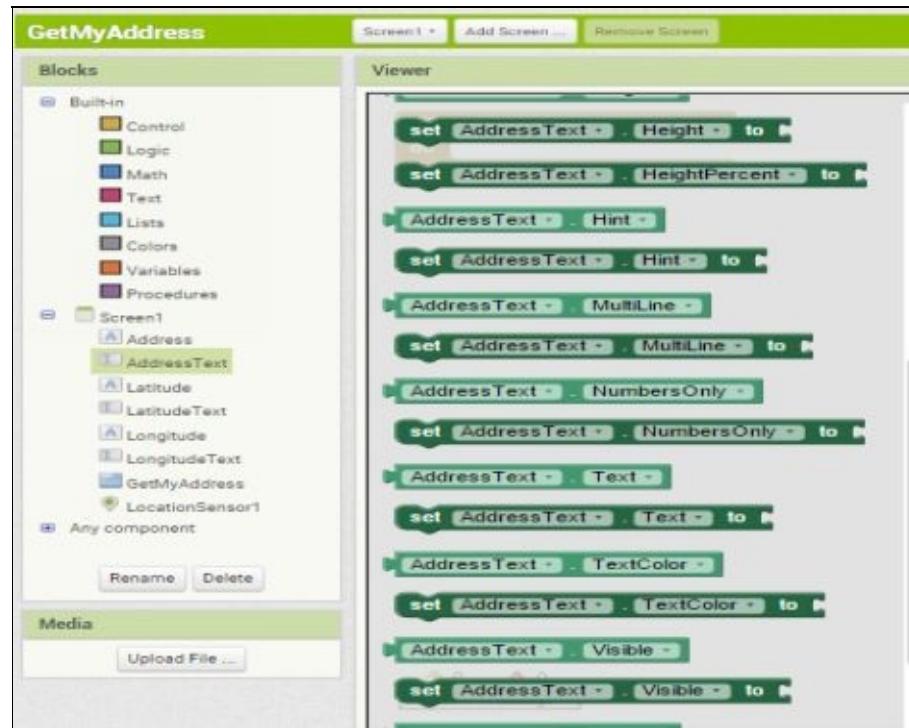

12. Now go to [Blocks](#).

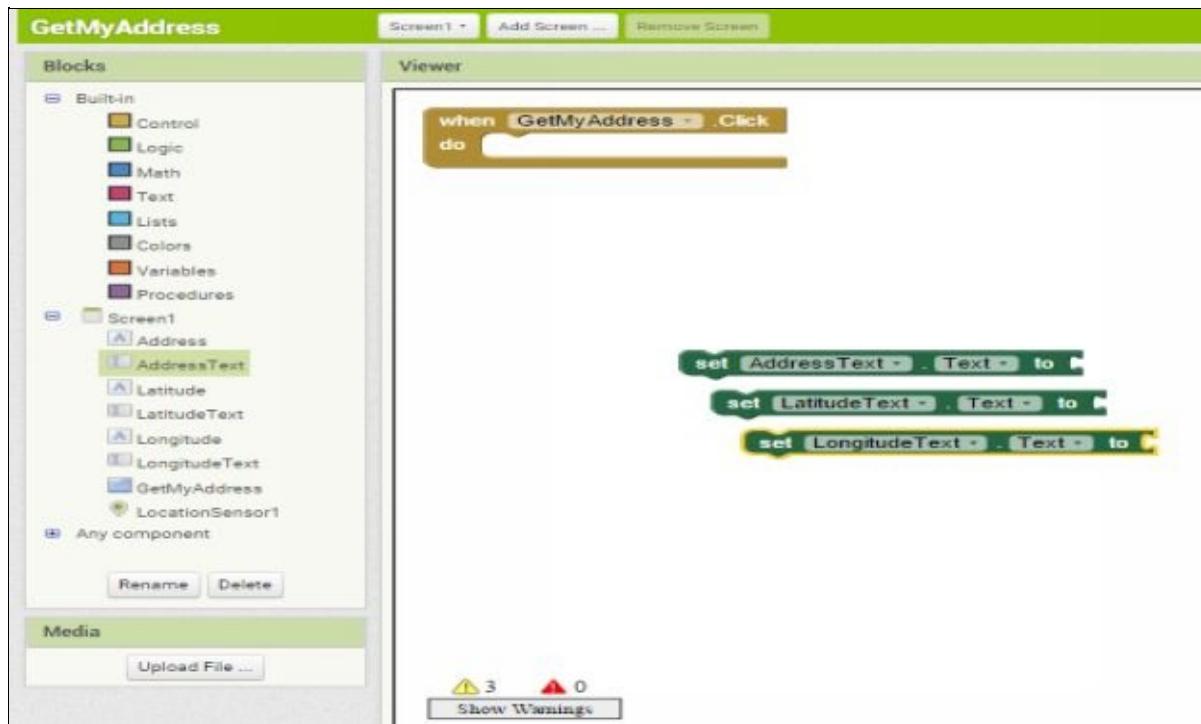

13. Click on **GetMyAddress** button component in left side and click on **block**. This is an event block which will decide what your app will do when ‘Get My Address’ button will be clicked. Here click is an event for Button1 component.

14. Now click on **AddressText** Text component and scroll down to select **block**.

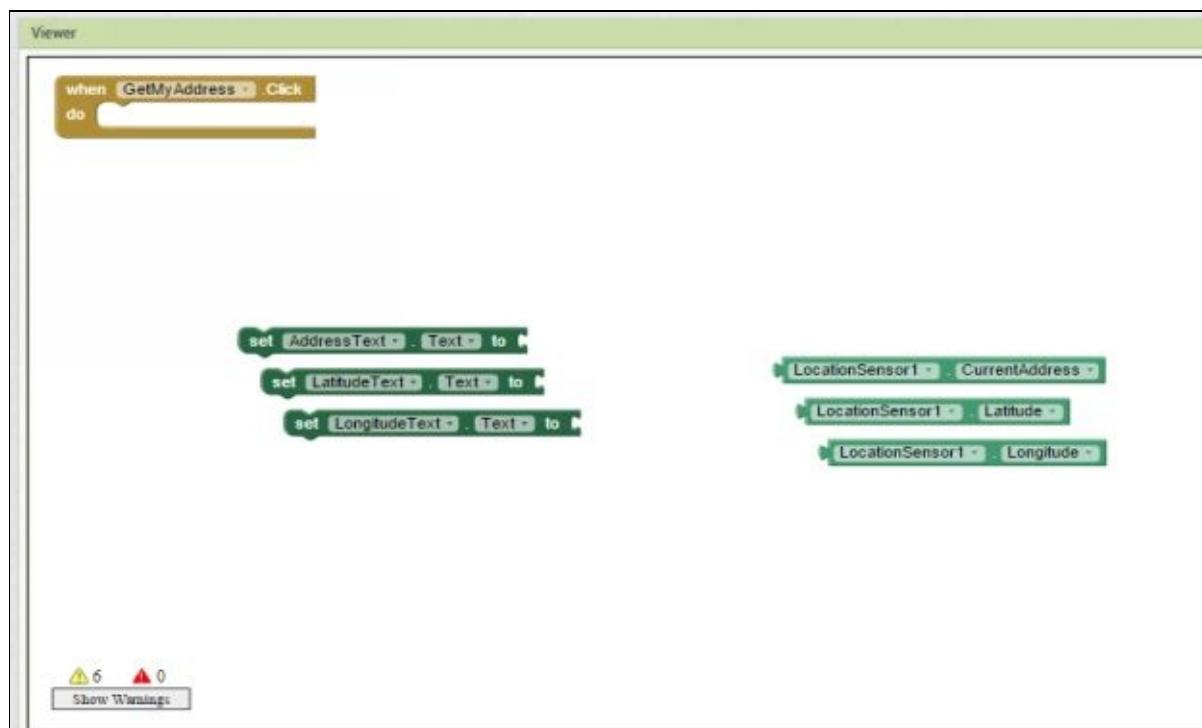

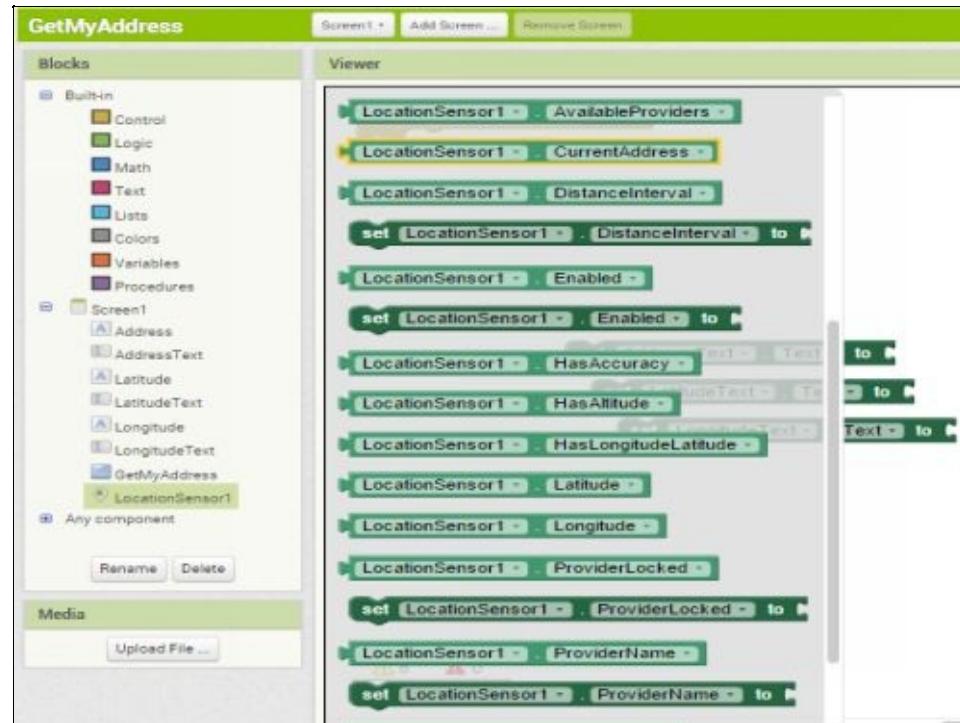

15. Now similarly select **LatitudeText** and **LongitudeText** components.

16. Now click on **LocationSensor1** Component and select these 3 **blocks**. These will use

your device's GPS or location sensor and will get your CurrentAddress, Latitude and Longitude.

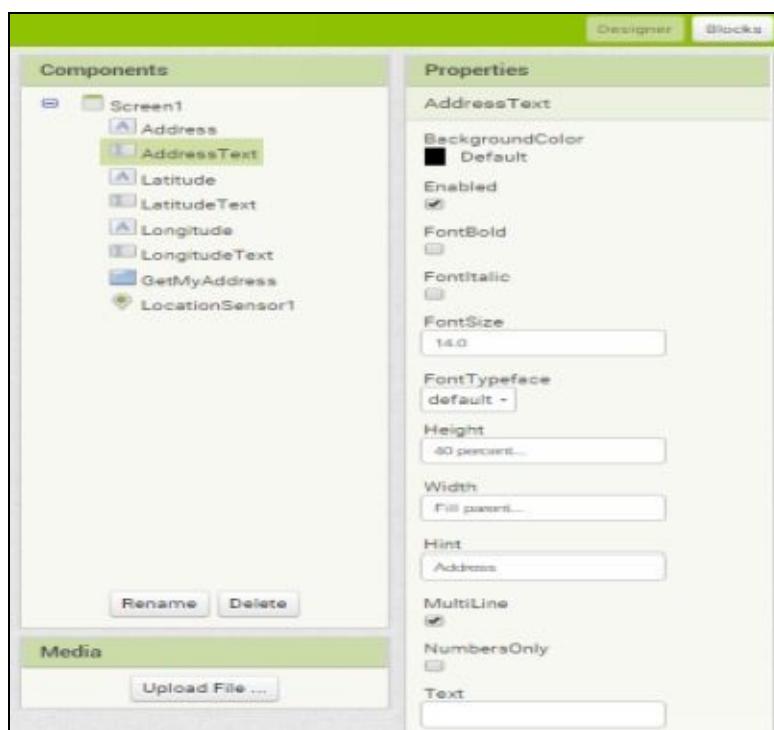

17. Now attach these **blocks** as shown below. So that when 'Get My Address' button is clicked your app will show your CurrentAddress, Latitude and Longitude in respective

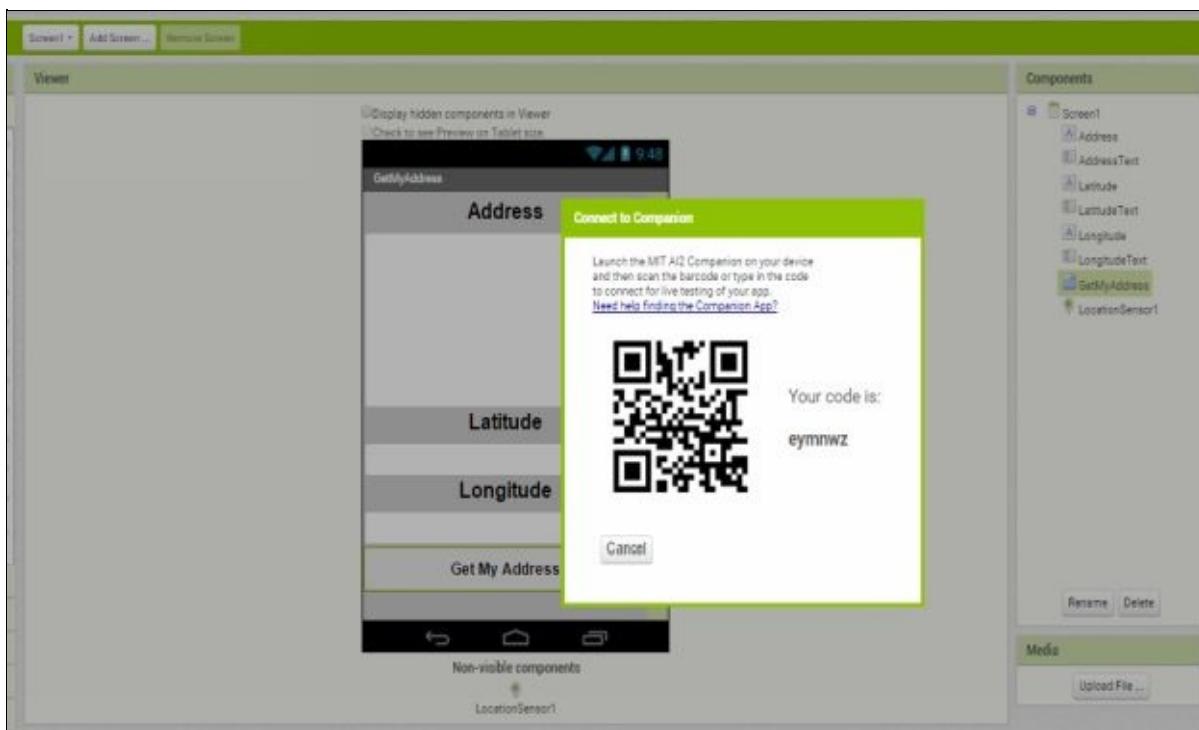

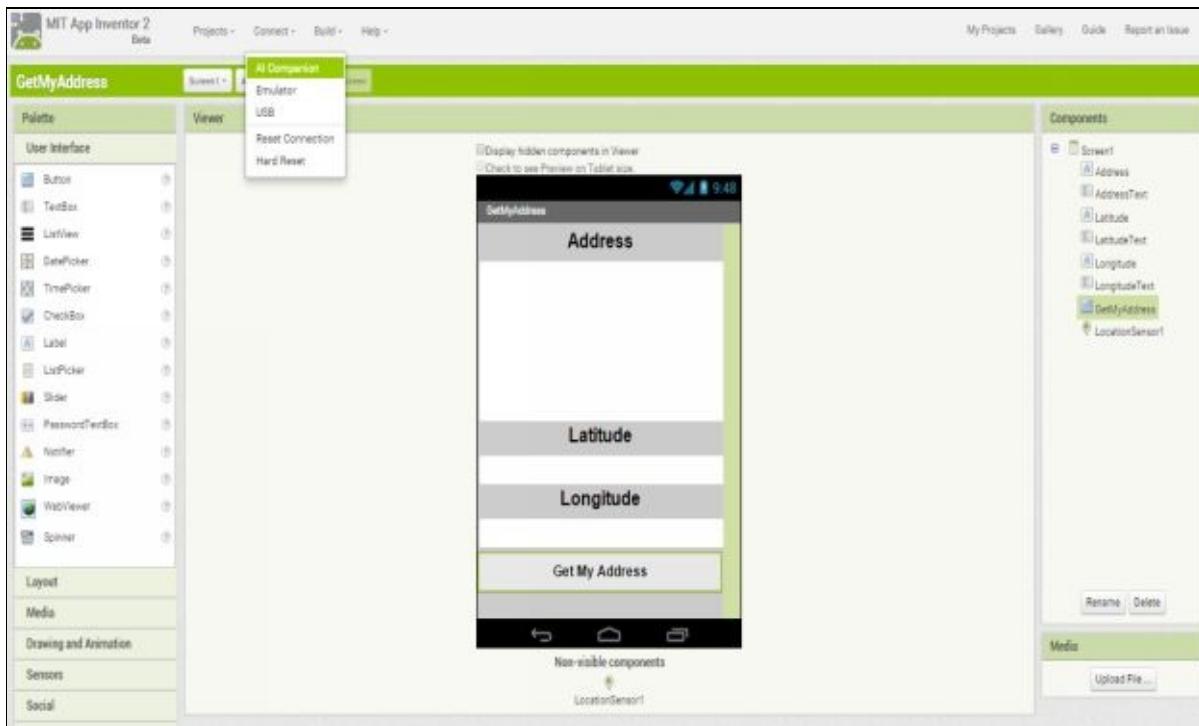

## Textboxes.

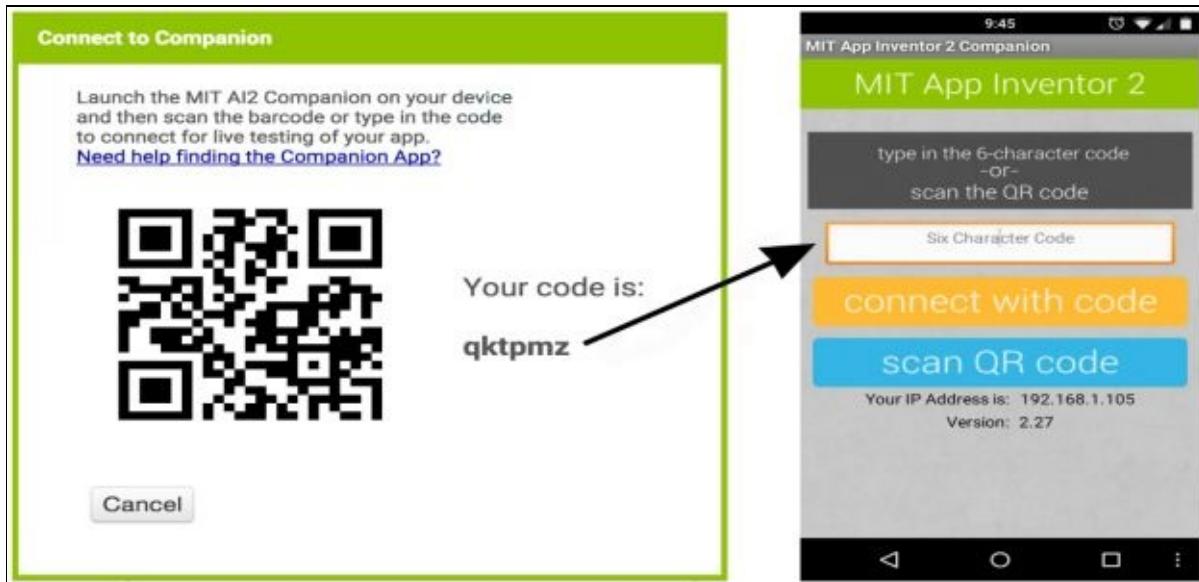

18. Now go to [Designer](#) and enable [Multiline](#) for [AddressText](#).

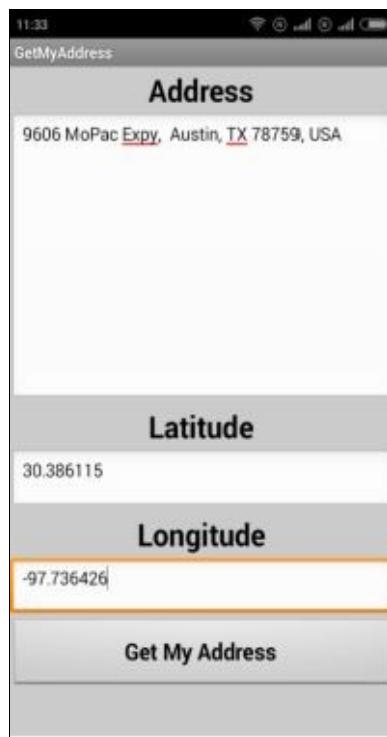

19. Click on [Connect](#) and select [AI Companion](#).

20. Now open [MIT App Inventor 2 Companion](#) in your mobile/Tablet. And enter the code or scan the [QR code](#) from your mobile and click on connect with code. Note:- Your Mobile/Tablet should be connected to same wi-fi/network to which your computer/Laptop is connected.

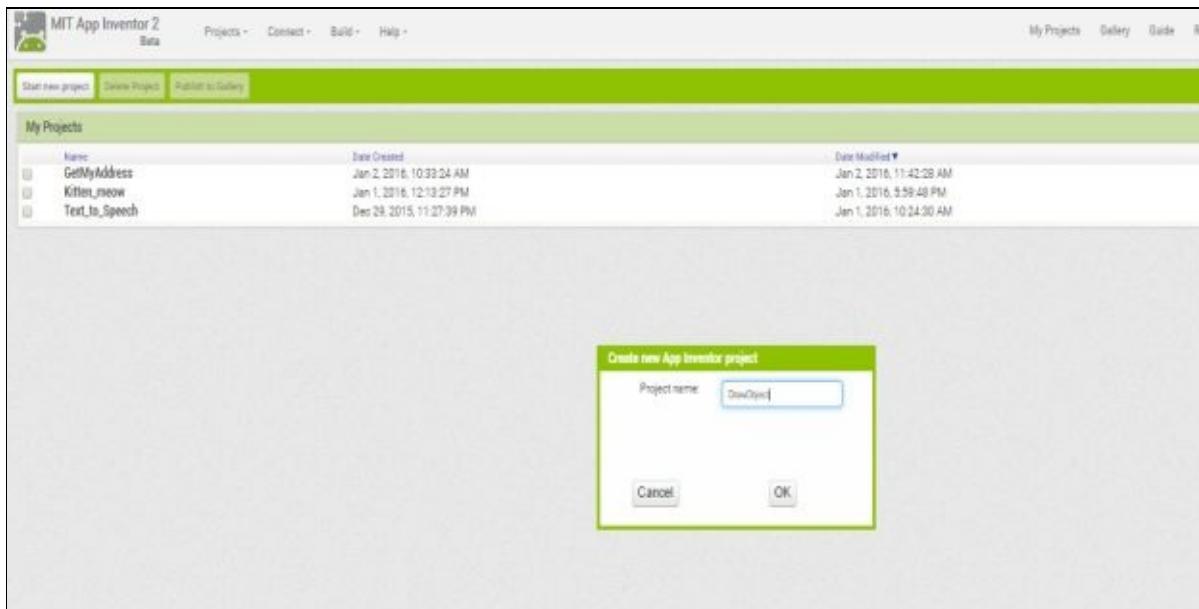

21. Now you should see your app in your phone for live testing. Enter Click on [Get My Address Button](#) to get your current [Address](#), [Latitude](#) and [Longitude](#). Note:-To test this app switch On GPS sensor in your phone/Tablet.

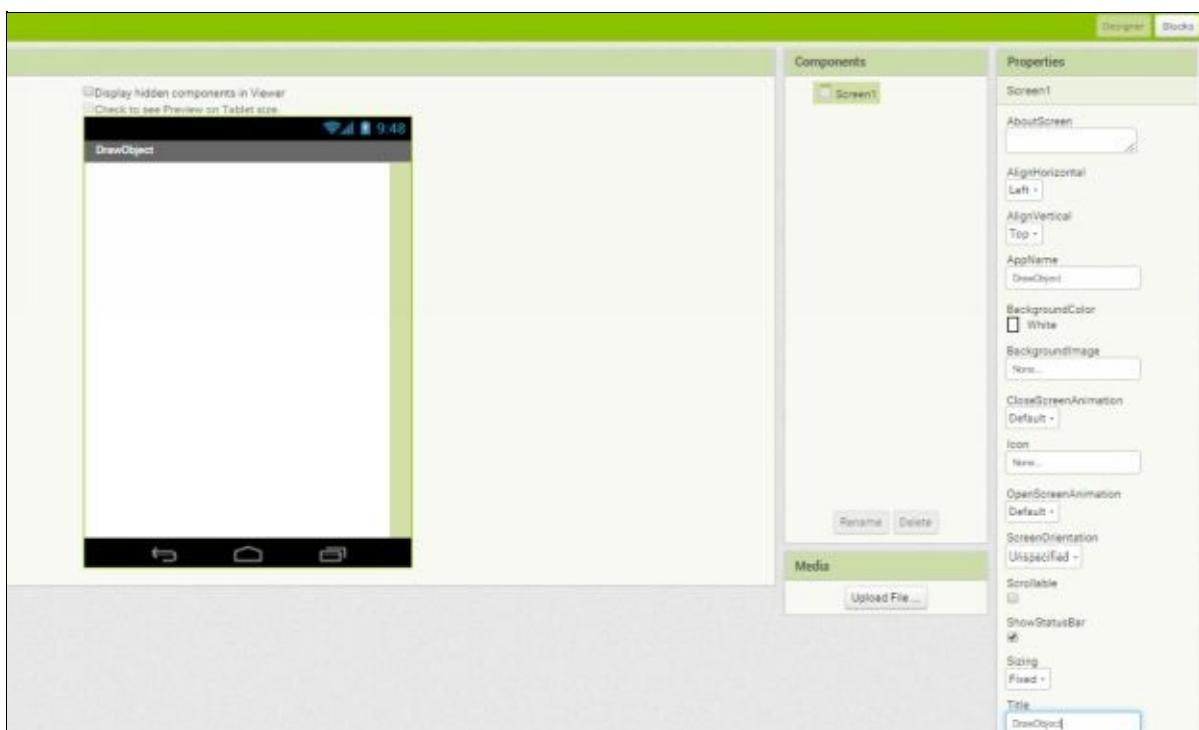

## Chapter 5: DrawObject App

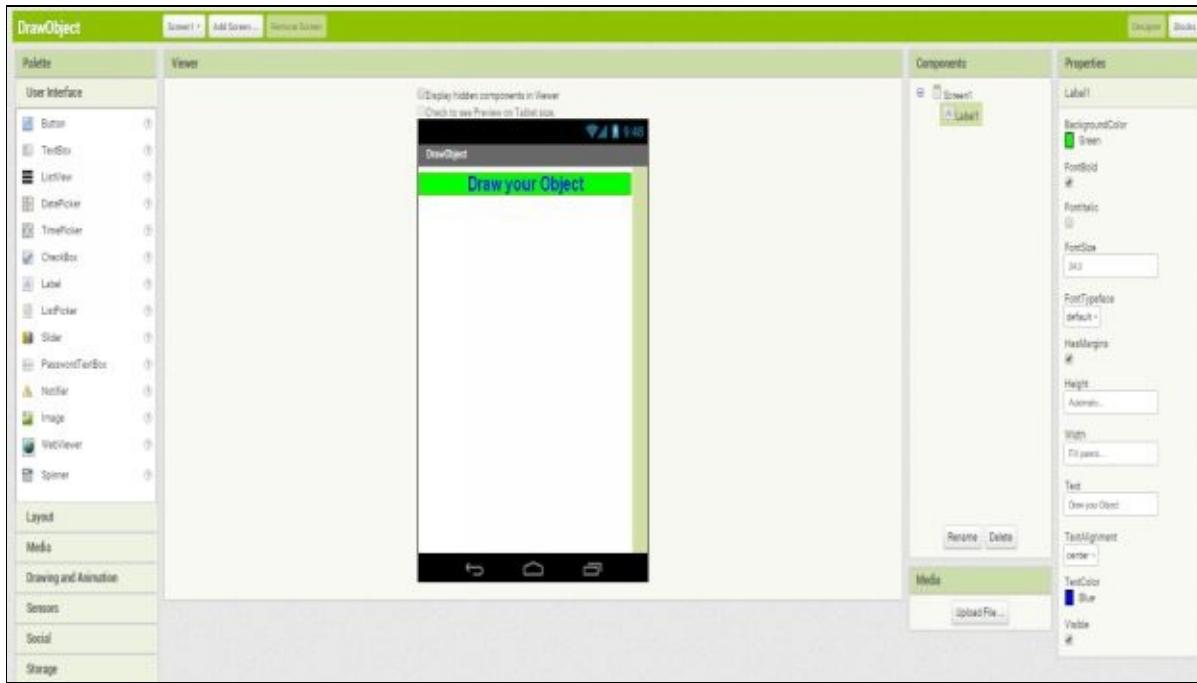

1. Click on [Start new project](#) and give it name **DrawObject** and click [OK](#).

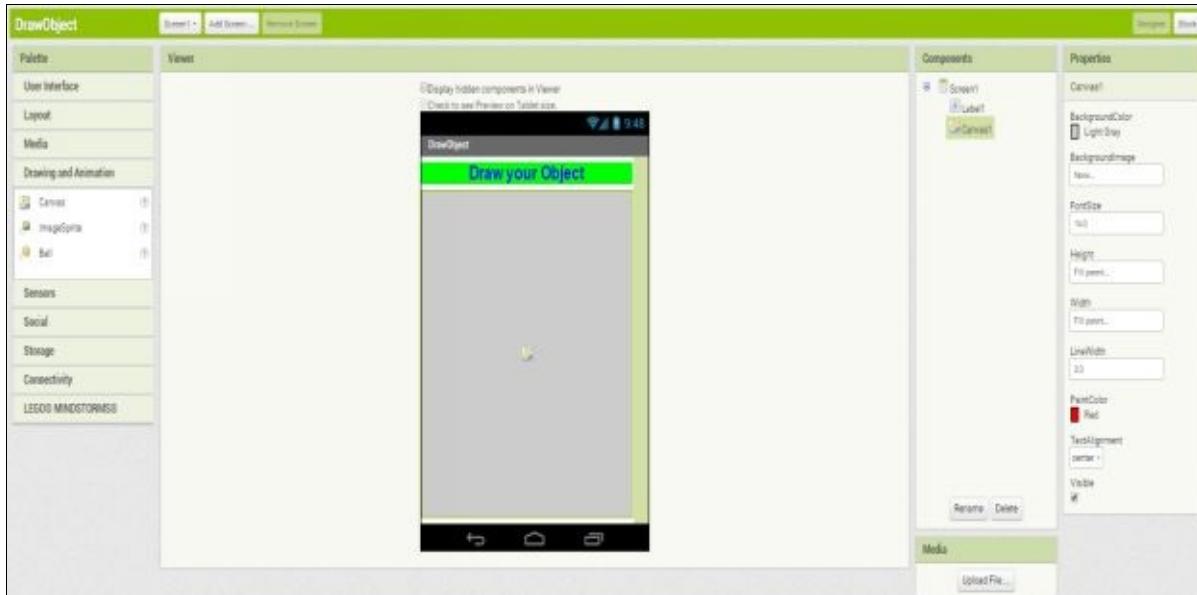

## 2. Change Screen1 Title to DrawObject.

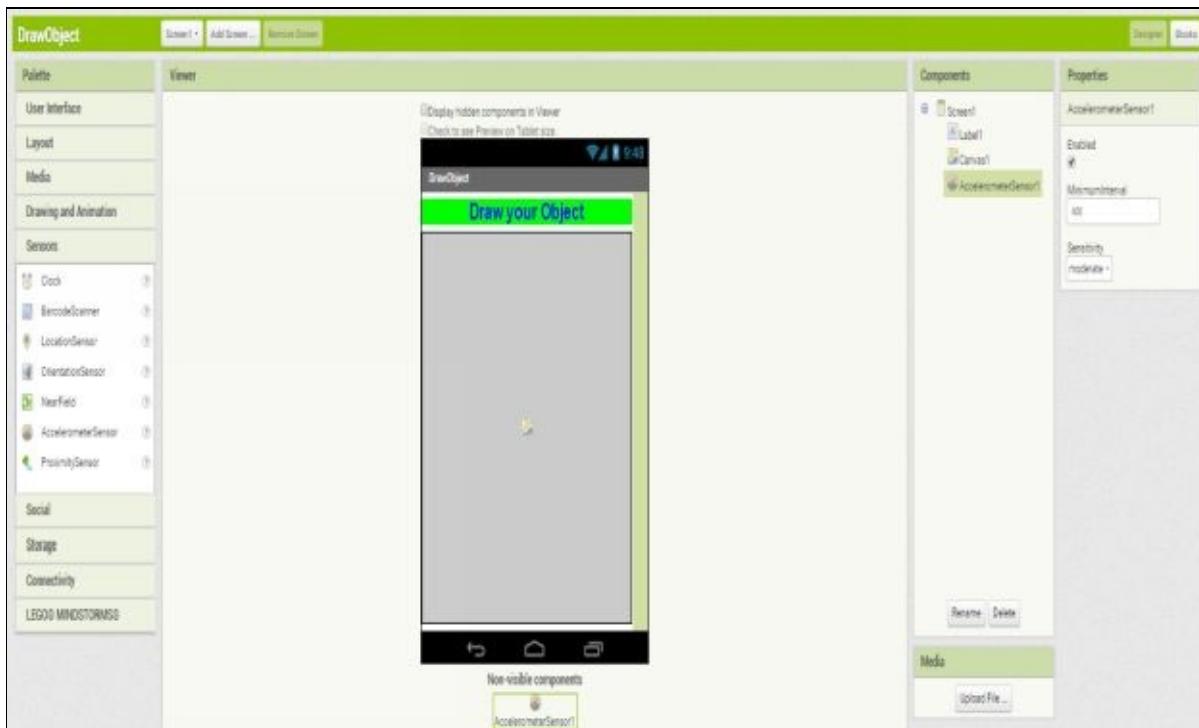

## 3. Drag a Label from Palette to Viewer Screen and set its Properties as shown below.

4. Drag a **Canvas** from palette to **Viewer** screen and set its **Properties** as shown below.

5. Drag an **AccelerometerSensor** from **Palette** to **Viewer** screen.

6. Change component names as shown below.

7. Now go to **Blocks** and click on **DrawingCanvas** component on left side and select **block**. This block will identify the event when you touch your app screen/canvas and drag it.

**DrawObject**

Blocks      Viewer

**Built-in**

- Control
- Logic
- Math
- Text
- Lists
- Colors
- Variables
- Procedures

**Screen1**

- DrawObject
- DrawingCanvas
- AccelerometerSensor1

**Any component**

```

when DrawingCanvas - Dragged
  startX startY prevX prevY currentX currentY draggedAnySprite
do [ ]
```

```

when DrawingCanvas - Flung
  x y speed heading xlabel ylabel flungSprite
do [ ]
```

```

when DrawingCanvas - TouchDown
  x y
do [ ]
```

```

when DrawingCanvas - TouchUp
  x y
do [ ]
```

```

when DrawingCanvas - Touched
  x y touchedAnySprite
do [ ]
```

```

call DrawingCanvas - Clear
```

```

call DrawingCanvas - DrawCircle
  centerX centerY radius color
do [ ]
```

**DrawObject**

Blocks      Viewer

**Built-in**

- Control
- Logic
- Math
- Text
- Lists
- Colors
- Variables
- Procedures

**Screen1**

- DrawObject
- DrawingCanvas
- AccelerometerSensor1

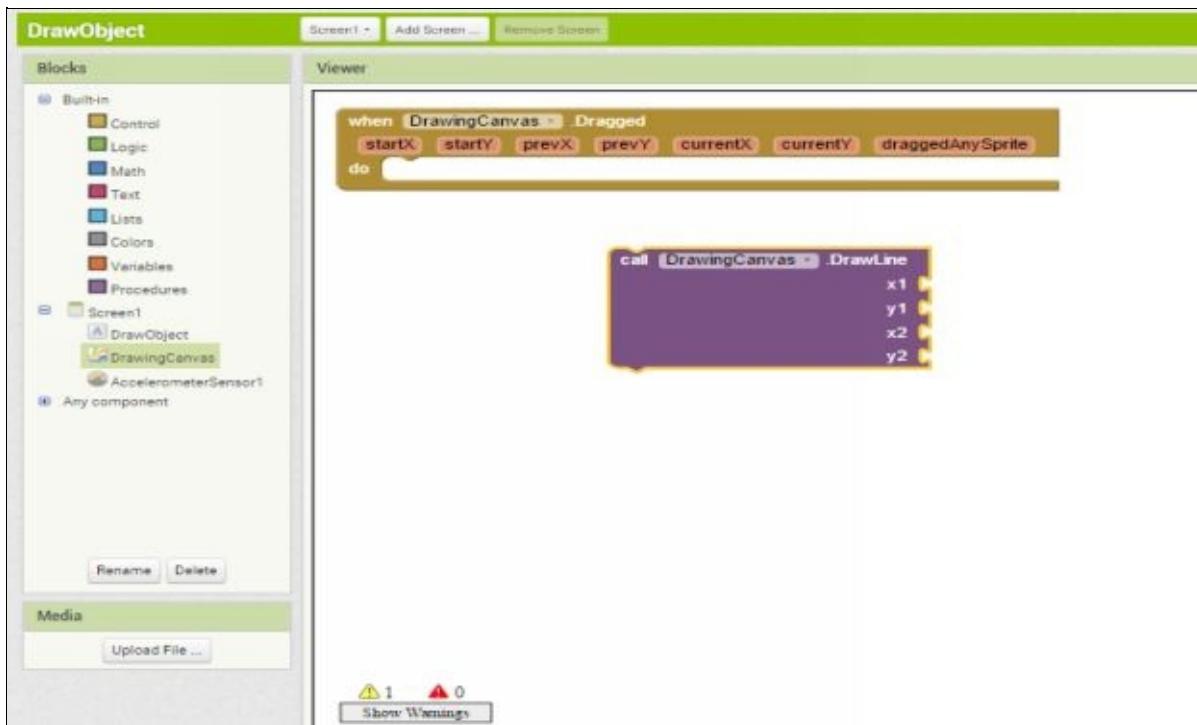

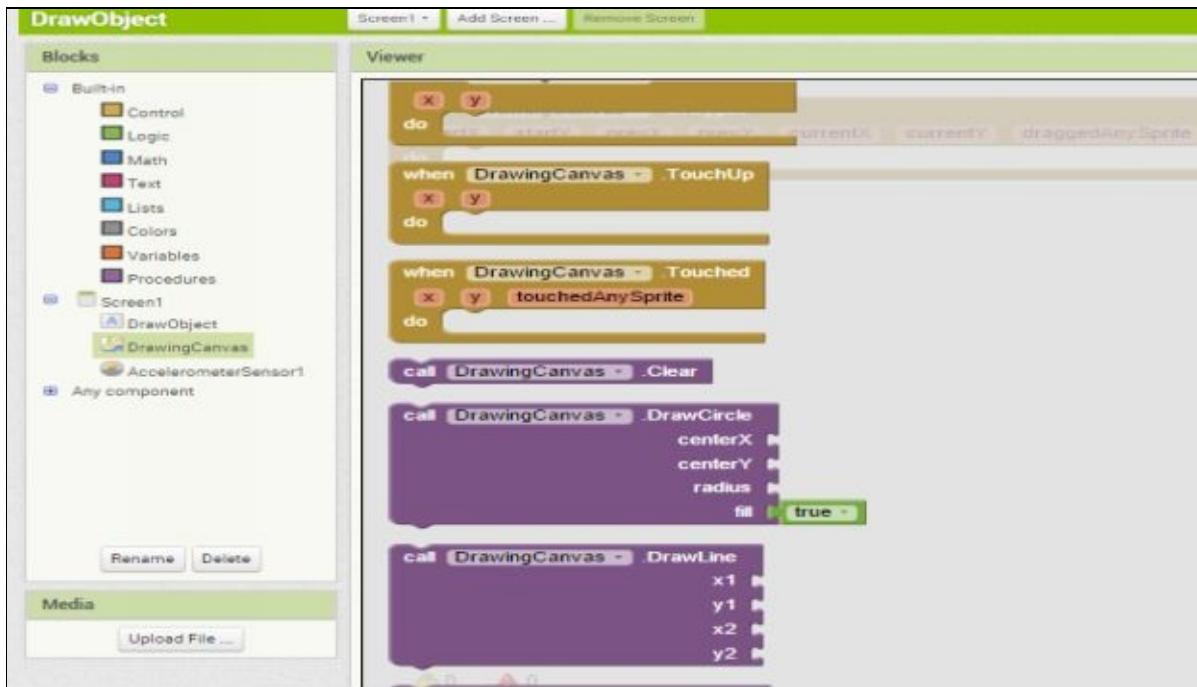

**Any component**

```

when DrawingCanvas - Dragged
  startX startY prevX prevY currentX currentY draggedAnySprite
do [ ]
```

8. Now select  block from **DrawingCanvas**. This block will draw a line on your canvas. A line has starting point(x1,y1) and ending point(x2,y2).

9. Now attach these **blocks** as shown below. So that when you touch the screen and drag it , a line will be drawn on your canvas. Here prevX and prevY will be the starting point of line and currentX and currentY will be the ending point of line.

```

when DrawingCanvas .Dragged
  startX startY prevX prevY currentX currentY draggedAnySprite
do call DrawingCanvas .DrawLine
  x1
  y1
  x2
  y2

```

Now Mouseover on **prevX** and select **get prevX** block.

```

when DrawingCanvas .Dragged
  startX startY prevX get prevX
  currentX currentY draggedAnySprite
do call DrawingCanvas
  set prevX to
    y1
    x2
    y2

```

```

when DrawingCanvas .Dragged
  startX startY prevX prevY currentX currentY draggedAnySprite
do call DrawingCanvas .DrawLine
  get prevX
  x1
  y1
  x2
  y2

```

Now attach this as show below.

```

when DrawingCanvas .Dragged
  startX startY prevX prevY currentX currentY draggedAnySprite
do call DrawingCanvas .DrawLine
  x1 get prevX
  y1
  x2
  y2

```

Similarly do it for **y1,x2,y2** and attach as shown below.

```

when DrawingCanvas .Dragged
  startX startY prevX prevY currentX currentY draggedAnySprite
do call DrawingCanvas .DrawLine
  x1 get prevX
  y1 get prevY
  x2 get currentX
  y2 get currentY

```

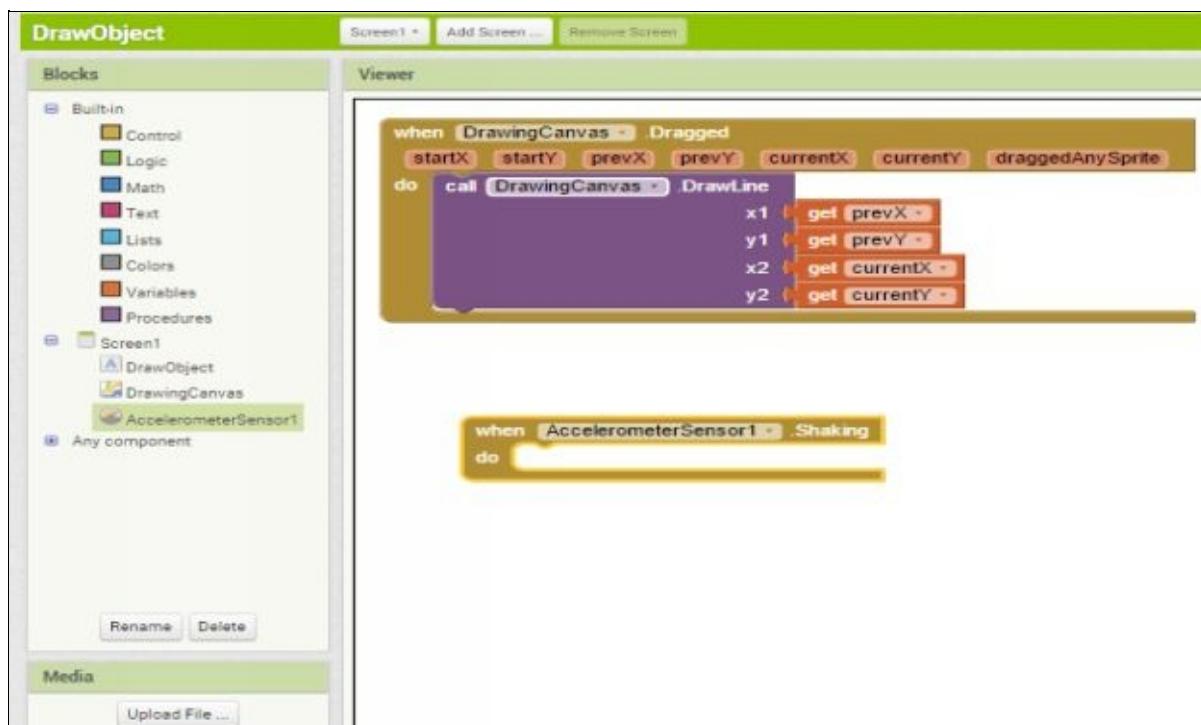

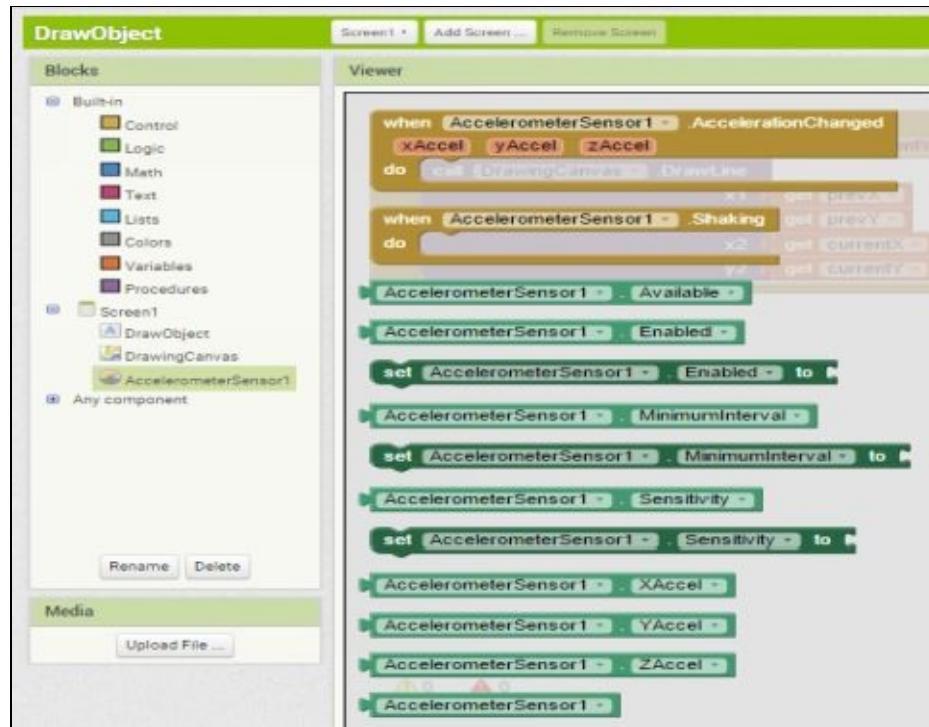

This logic will draw a line on canvas where **prevX** and **prevY** are the co-ordinates of starting point of line and **currentX** and **currentY** are the co-ordinates of end point of line.

10. Now we will add logic to clear canvas on shaking the phone.

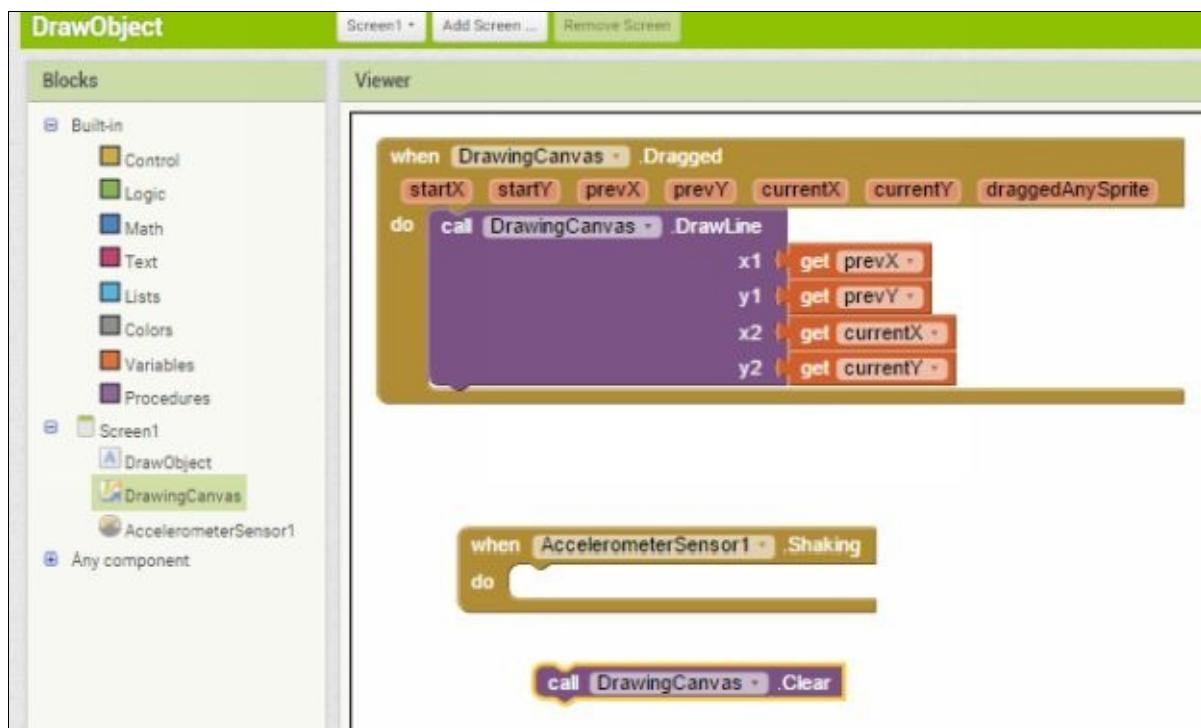

For this click on **AccelerometerSensor1** component on left side and select

**when AccelerometerSensor1 .Shaking**

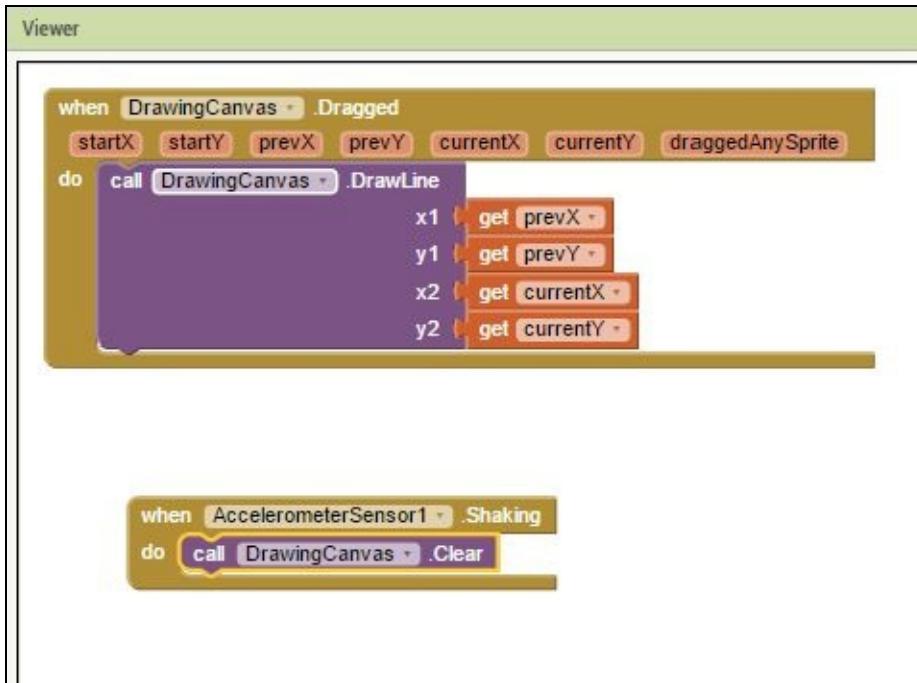

**do** block. This block will identify shaking activity of your phone.

11. Now click on **DrawingCanvas** and select block.

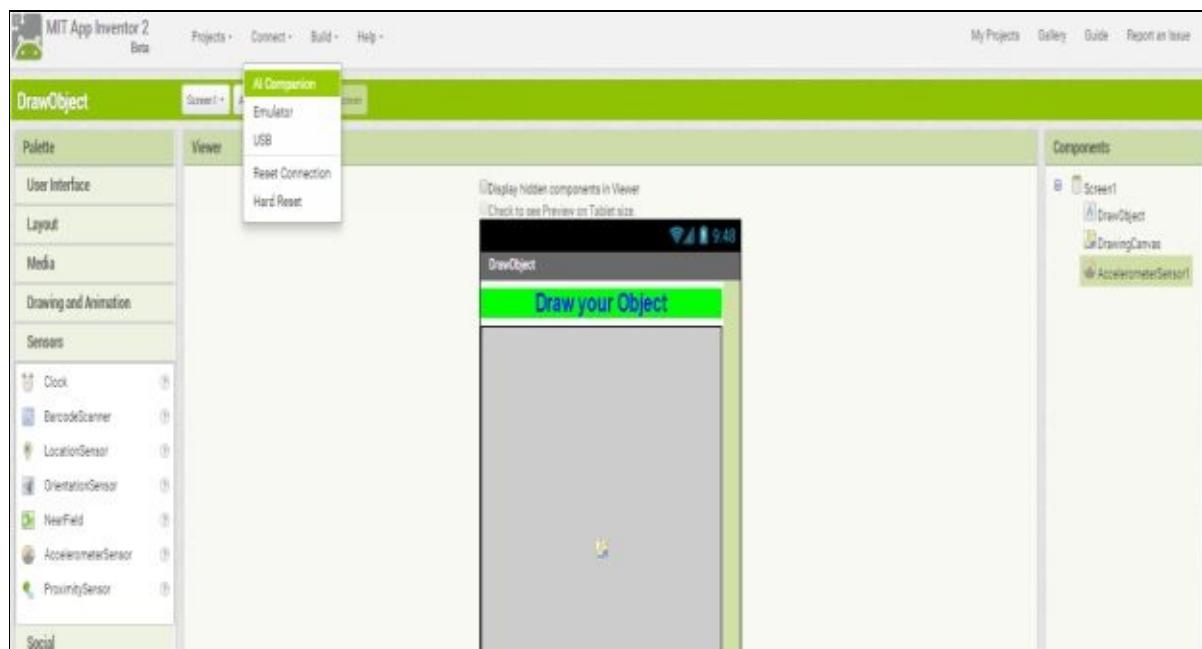

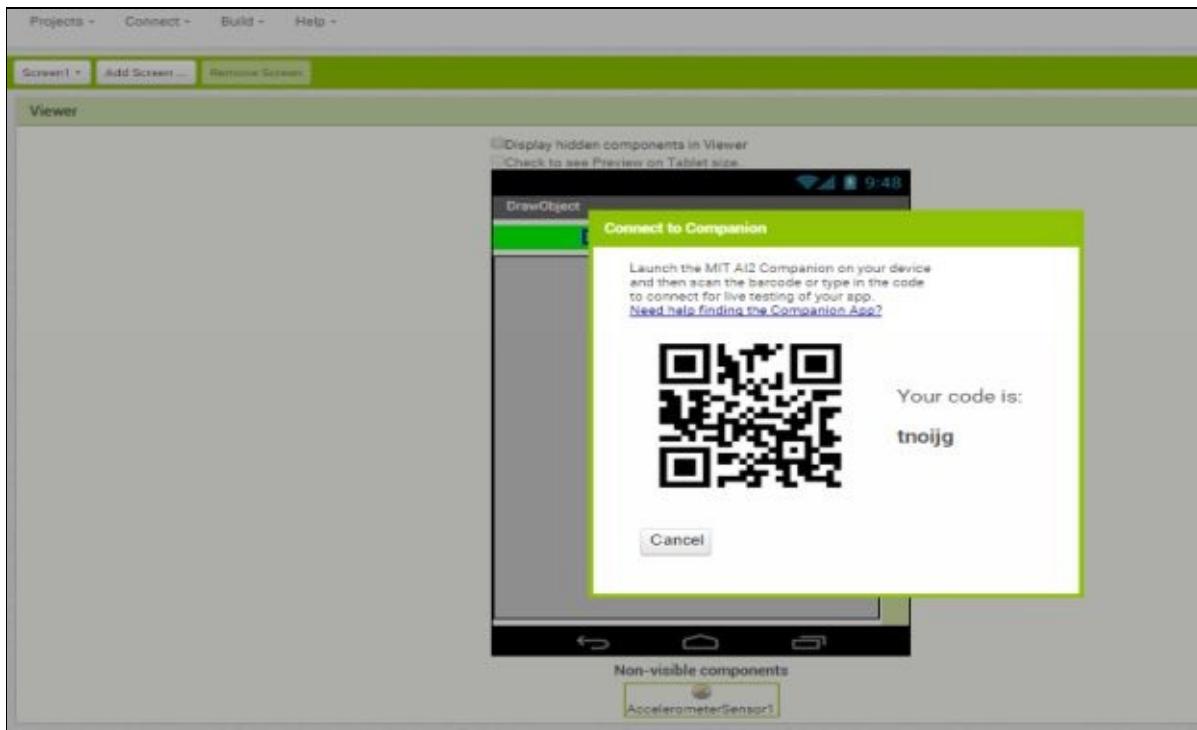

12. Now attach blocks as shown below. So when you shake your phone Canvas should be cleared.

This **block** will clear our **canvas** when we shake our phone.

13. Now go to **Designer** and click on **Connect** and select **AI Companion**.

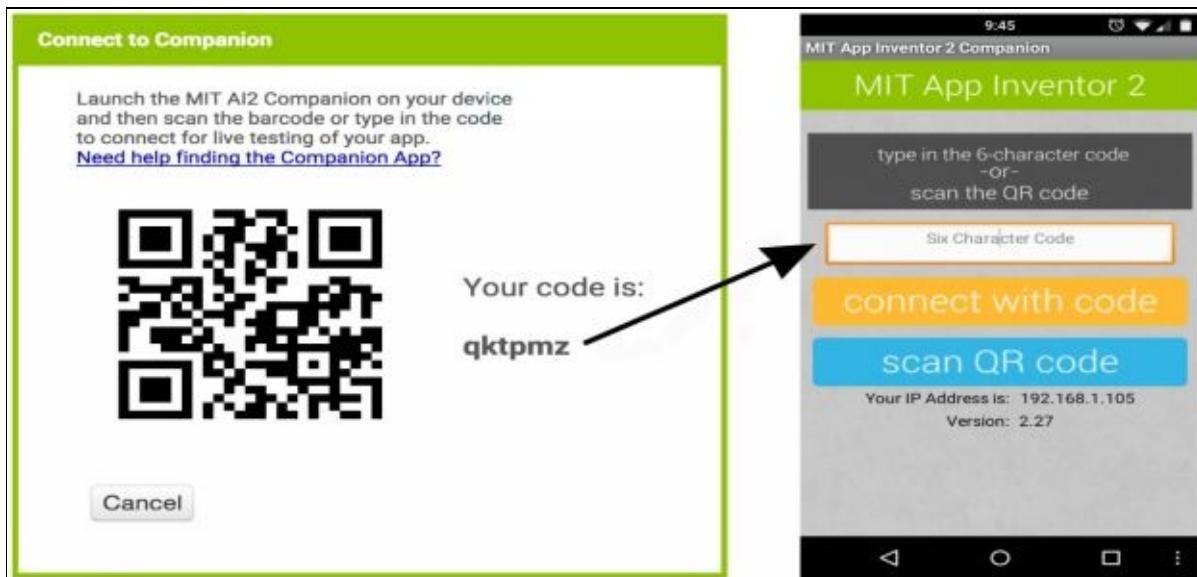

#### 14. Now open [MIT App Inventor 2 Companion](#) in your mobile/Tablet.

And enter the code or scan the [QR code](#) from your mobile and click on connect with code.

Note:-Your Mobile/Tablet should be connected to same wi-fi/network to which your computer/Laptop is connected.

#### 15. Now you should see your app in your phone for live testing. [Draw anything on canvas](#) by touching screen and dragging it to draw your object. And [shake your phone to clear](#) your canvas.

Shake your phone to clear your canvas !!!

## Chapter 6: Shaking Colors App

1. Click on [Start new project](#) and give it name [Shaking\\_colors](#) and click OK.

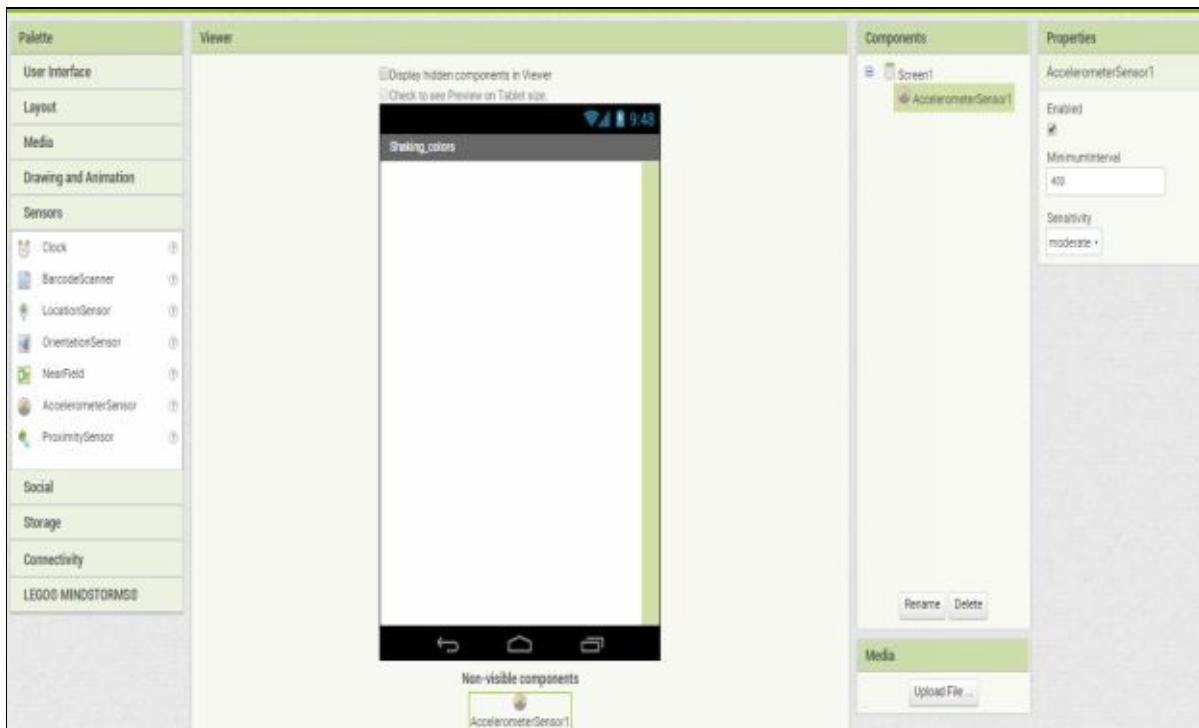

The screenshot shows the MIT App Inventor 2 Beta interface. At the top, there's a navigation bar with links for 'Projects', 'Connect', 'Build', 'Help', 'My Projects', and 'Gallery'. Below the navigation bar is a green header bar with buttons for 'Start new project', 'Delete Project', and 'Publish to Gallery'. The main area is titled 'My Projects' and lists four existing projects: 'DrawObject', 'GetMyAddress', 'Kitten\_meow', and 'Text\_to\_Speech'. Each project entry includes its name, date created, and date modified. A modal dialog box is open in the center, titled 'Create new App Inventor project'. It contains a 'Project name:' input field with the value 'Shaking\_colors'. There are 'Cancel' and 'OK' buttons at the bottom of the dialog.

## 2. Change Screen1 Title to Shaking\_colors.

The screenshot shows the MIT App Inventor 2 Designer interface. On the left is a preview window showing a smartphone screen with the title 'Shaking.colors'. To the right is the 'AboutScreen' properties panel. The properties listed include:

- AboutScreen: (empty)
- AlignHorizontal: Left
- AlignVertical: Top
- AppName: Shaking\_colors
- BackgroundColor: White
- BackgroundImage: None
- CloseScreenAnimation: Default
- Icon: None
- OpenScreenAnimation: Default
- ScreenOrientation: Unspecified
- Scalable: False
- ShowStatusBar: True
- Sizing: Fixed
- Title: Shaking\_colors

## 3. Drag an AccelerometerSensor component from Palette to Viewer screen.

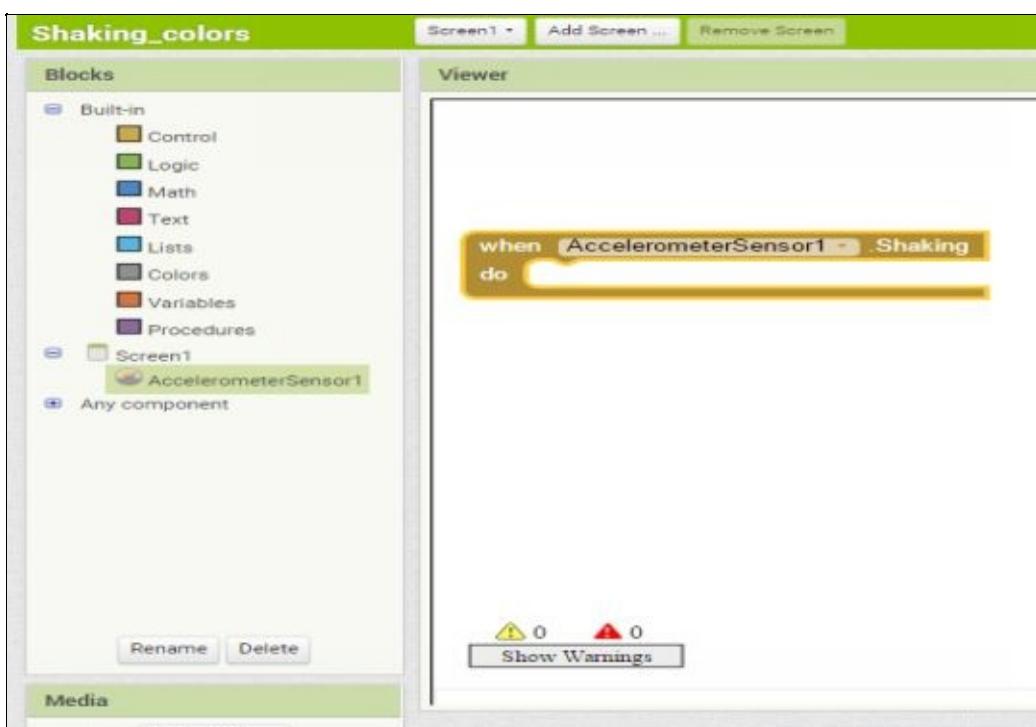

#### 4. Now go to [Blocks](#).

5. Click on [AccelerometerSensor1](#) component on left side and select [block](#). This block will identify shaking activity of your phone.

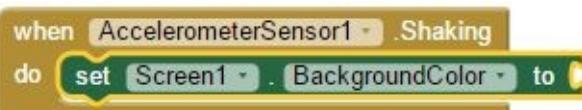

6. Now click on **Screen1** and scroll down to select **block**. This block will set the background color of your screen.

7. Now connect the **blocks** as shown below. So that when you shake your phone app screen color will change.

8. Now click on **Colors** under **Built-in** and scroll down to select

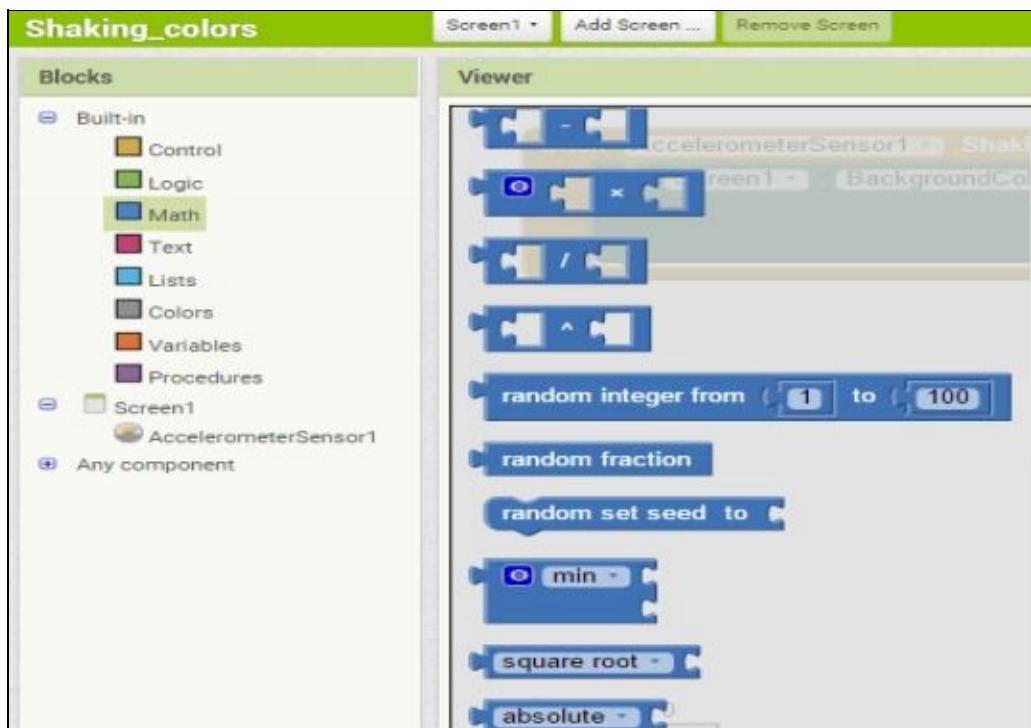

**block**. This block will define the color of the app screen to be changed. These 3 values(255,0,0) in this block will make up a color.

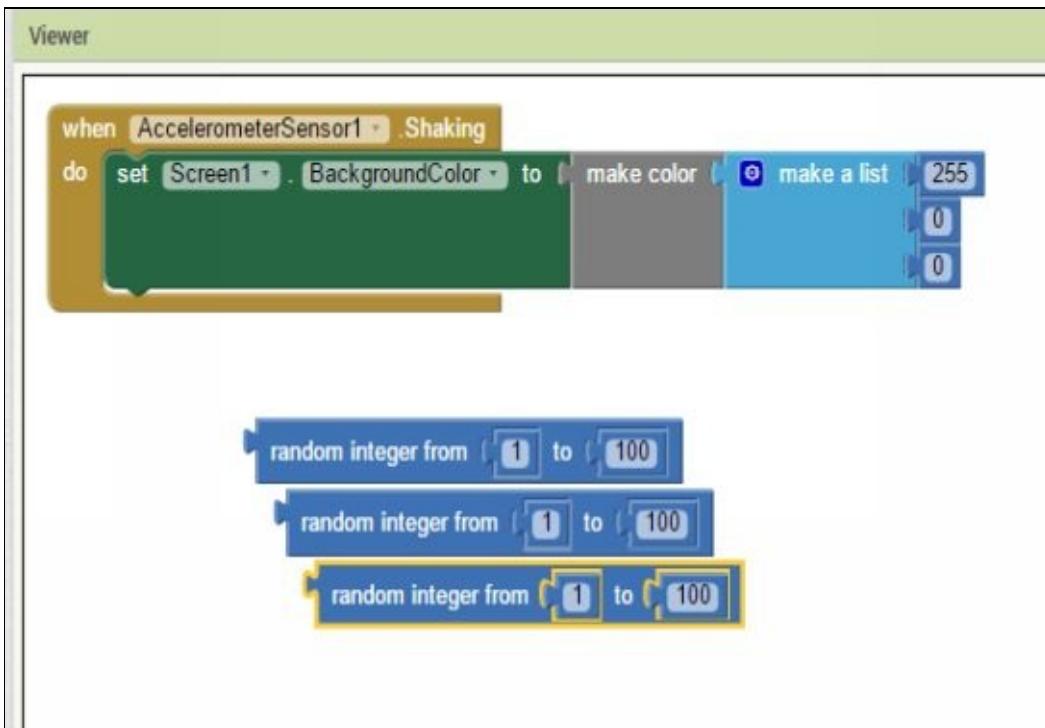

9. Now attach the **blocks** as shown below. So that when you shake your phone your app screen color will be changed.

10. Now click on **Math** under **Built-in** and select **random integer from [1] to [100]** block 3 times or you can copy paste the **same block** 3 times. This block will return an integer value between 1 and 100.

11. Now change the **values** for **blocks** to 0 to 255. Because a color is made up of these 3 values which range between 0 and 255.

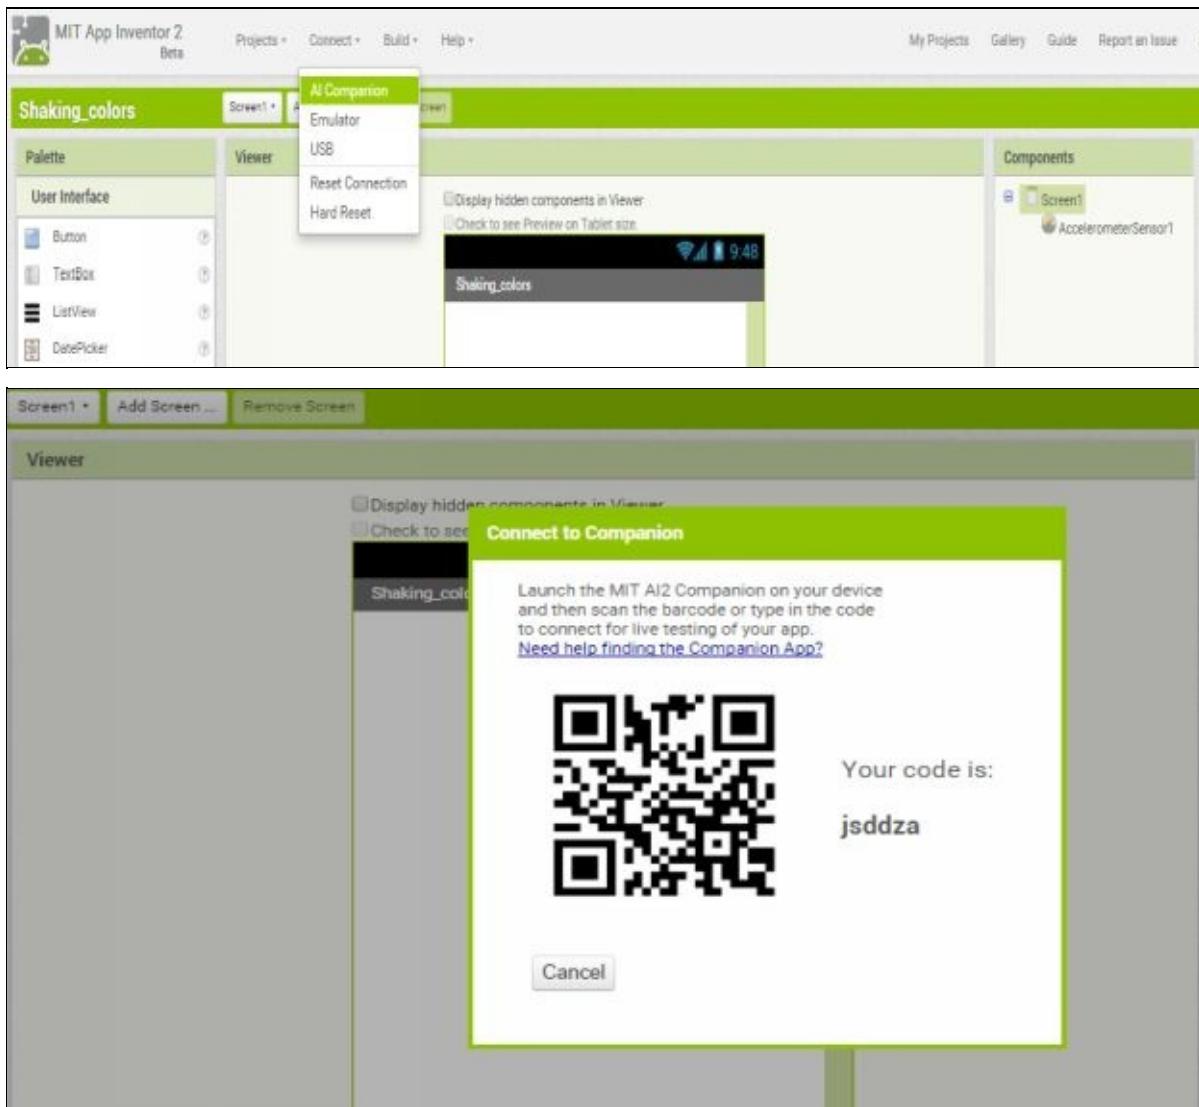

12. Now attach **blocks** as shown below. So when you shake your phone your screen color will be changed randomly which will be defined by ‘make color’ block.

**Note:-**To delete a block, you can select that block and press delete button or drag that block to bin.

13. Now go to **Designer** and click on **Connect** and select **AI Companion**.

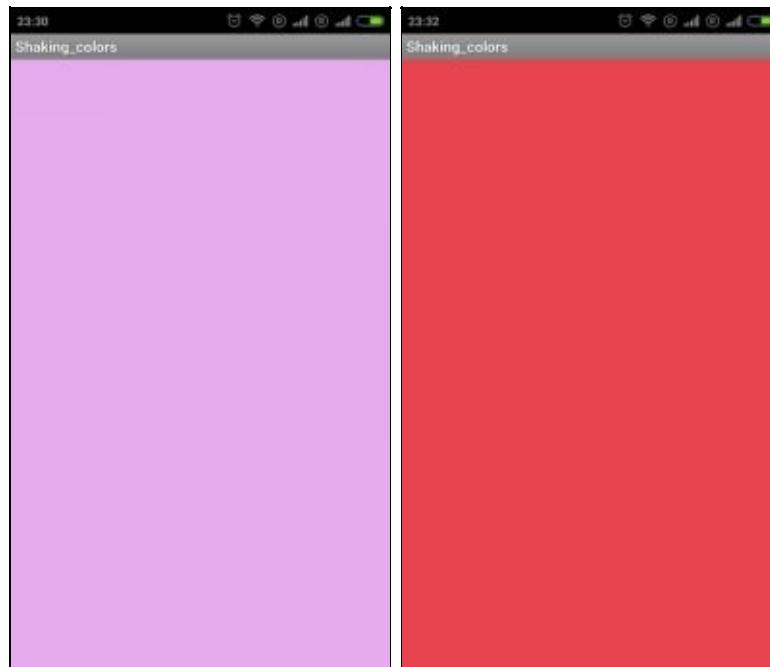

14 Now open [MIT App Inventor 2 Companion](#) in your mobile/Tablet.

And enter the code or scan the [QR code](#) from your mobile and click on connect with code.

Note:-Your Mobile/Tablet should be connected to same wi-fi/network to which your computer/Laptop is connected.

15. Now you should see your app in your phone for live testing. Shake your phone to change screen colors.

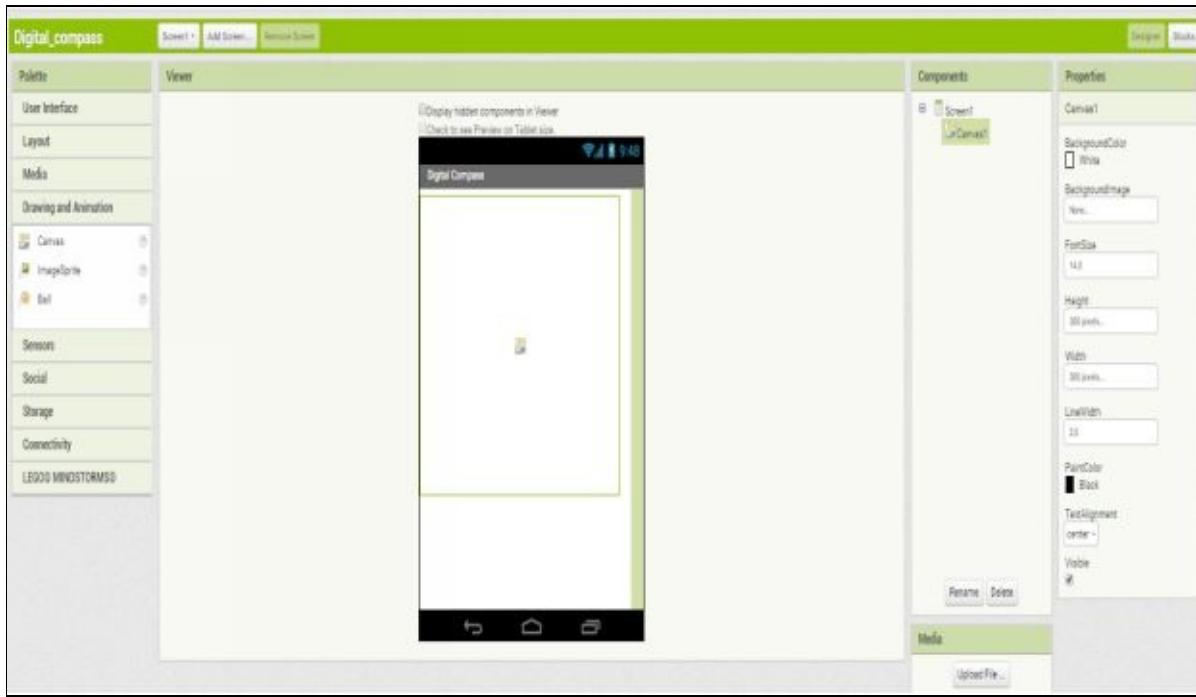

## Chapter 7: Digital Compass App

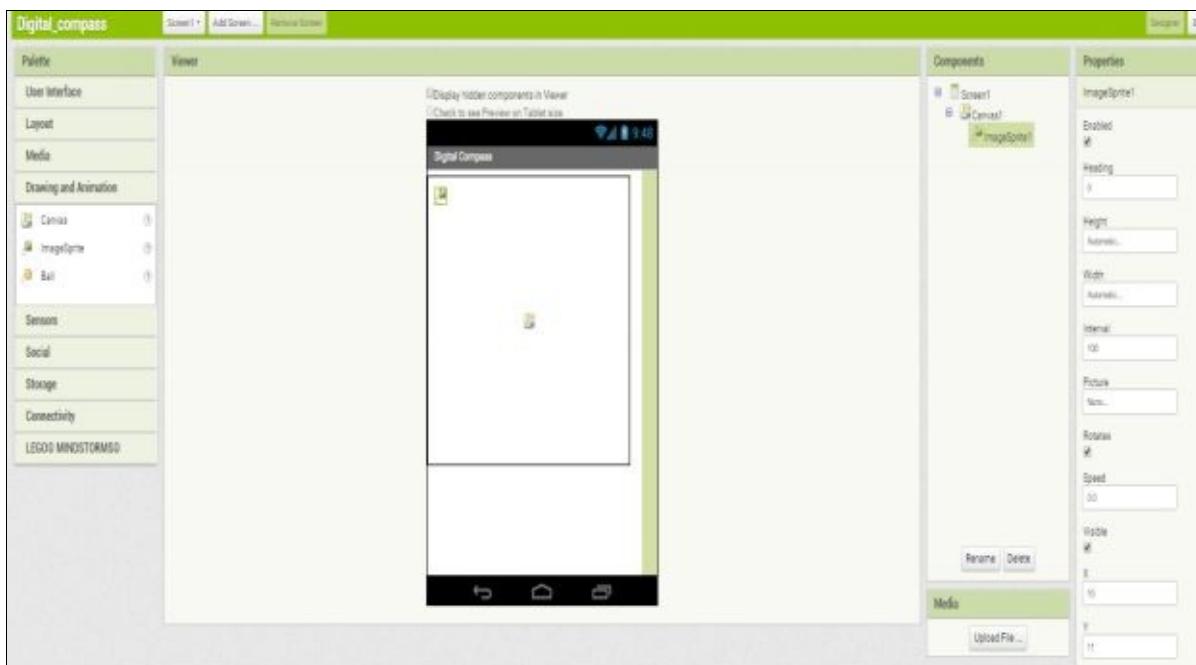

1. Click on [Start new project](#) and give it name [Digital\\_compass](#) and click **OK**.

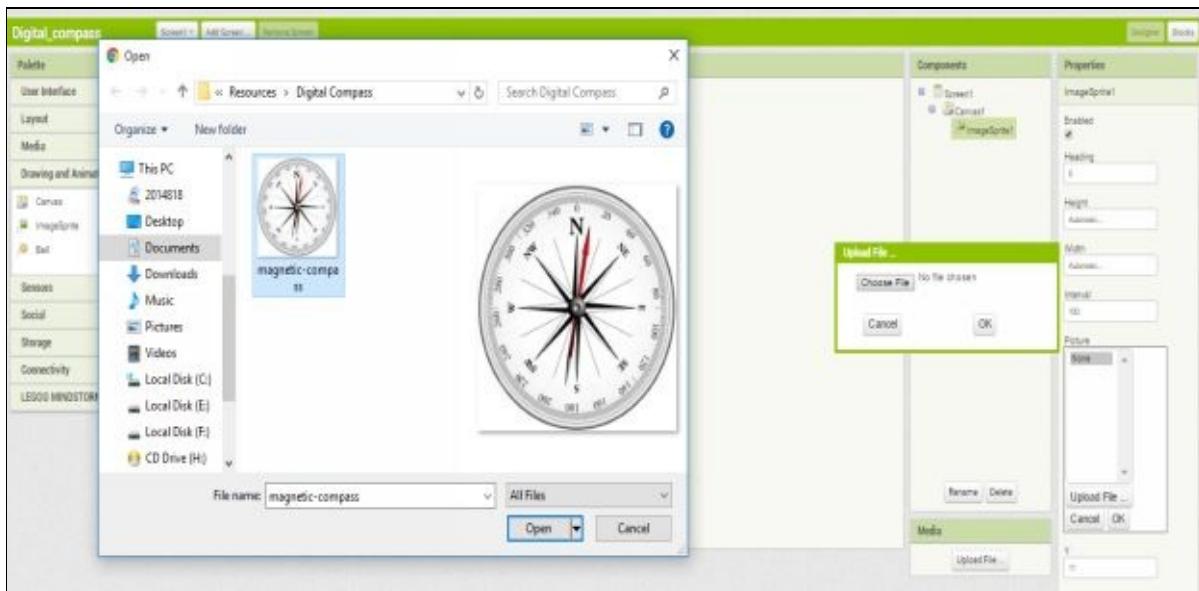

## 2. Change the Screen1 Title to Digital Compass.

## 3. Now Drag a Canvas to the Viewer screen and set its Height and Width to 300 pixels for both.

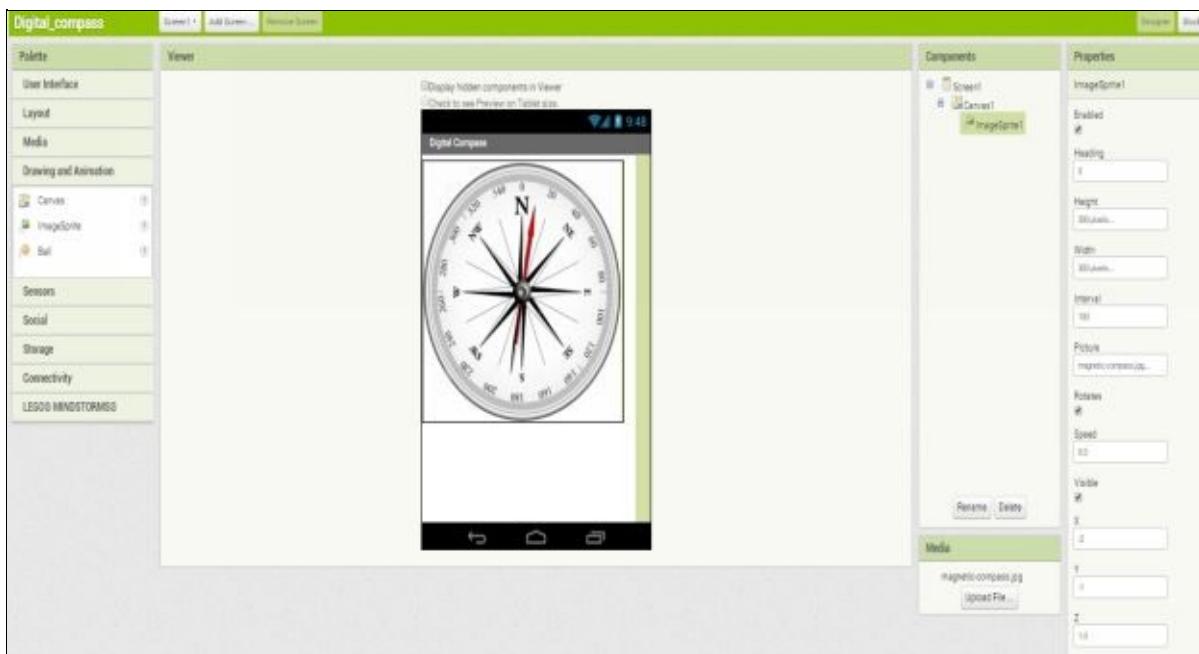

4. Now Drag an **ImageSprite** inside the **canvas** on **Viewer** screen and set **Image** to be **magnetic-compass** image. This image represents directions.

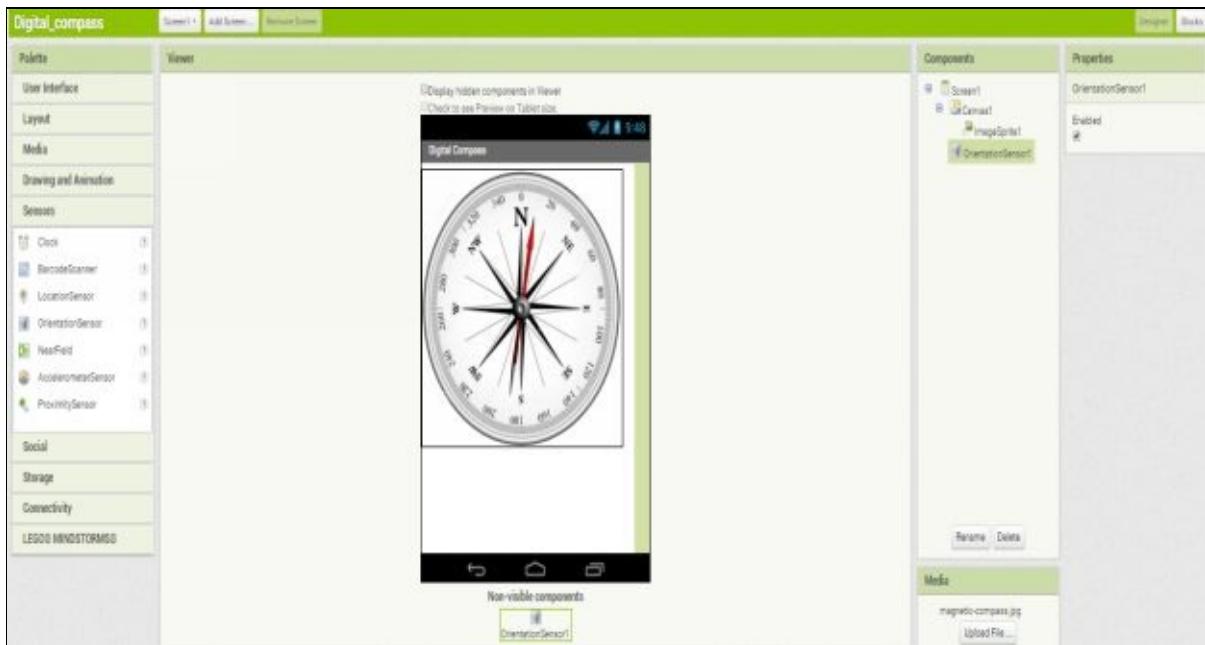

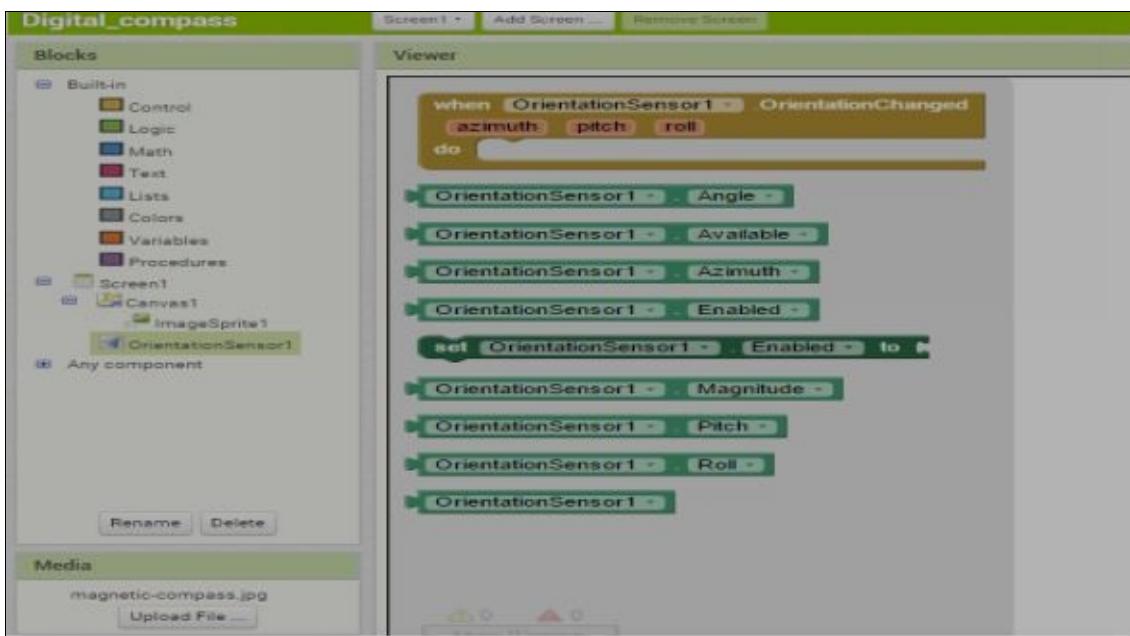

5. Now set **ImageSprite1** Image Height to 300 pixels and Width to 300 pixels and adjust the **Image on Canvas** to fit it.

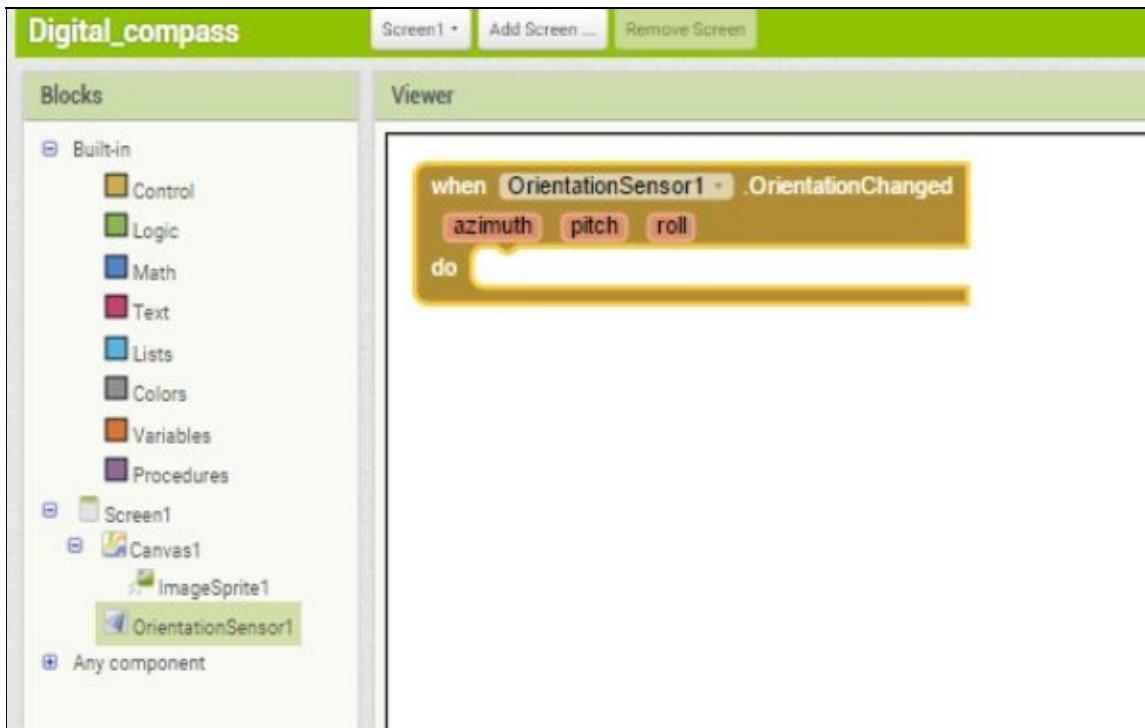

6. Now drag an OrientationSensor from **Palette** to **Viewer** screen. This is a non-visible component.

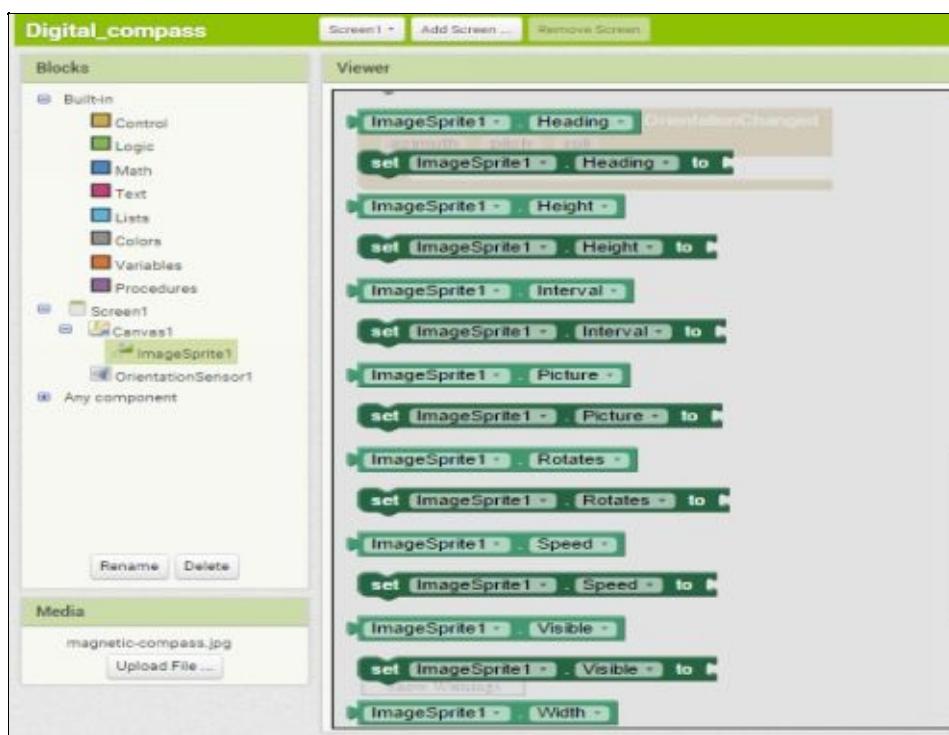

7. Now go to **Blocks** and click on **OrientationSensor1** on left side and select **block**. This block will decide what your app should do when your phone's orientation is changed.

8. Now click on **ImageSprite1** and scroll down to select **blocks**. These blocks will help image to rotate and pint to a particular direction.

9. Now connect the **blocks** as shown below. So when You change your Phone's orientation your compass will rotate to a direction.

10. Now click on **Logic** under **Built-in** and select **true** block and attach it like shown below. This will enable compass to rotate.

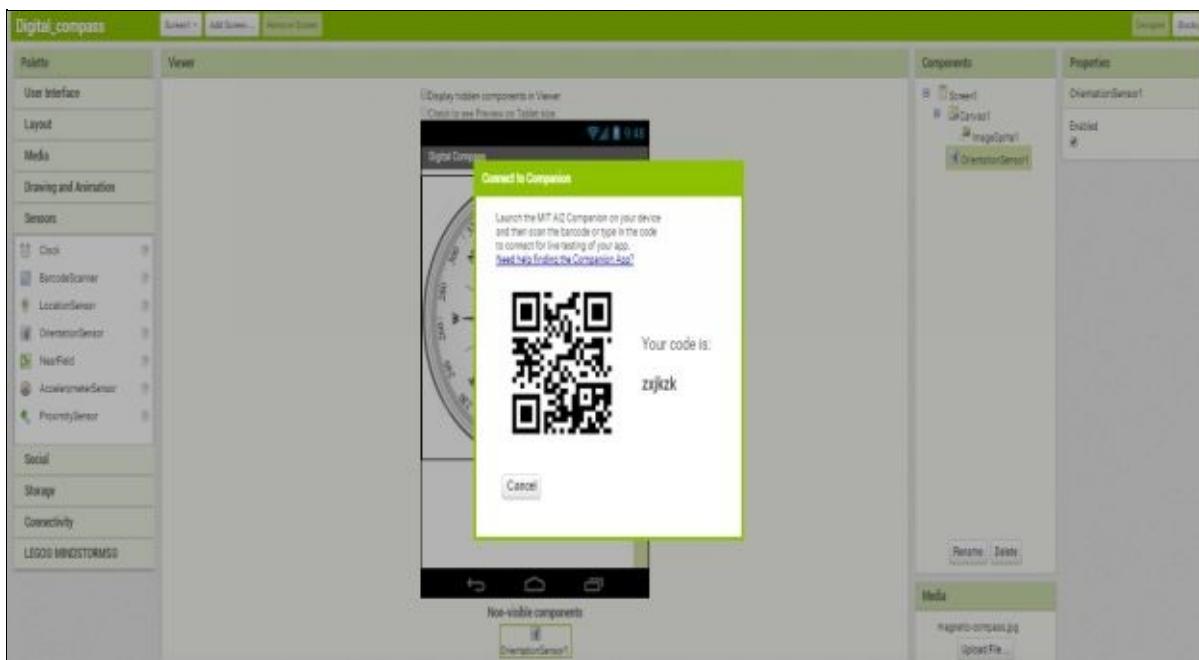

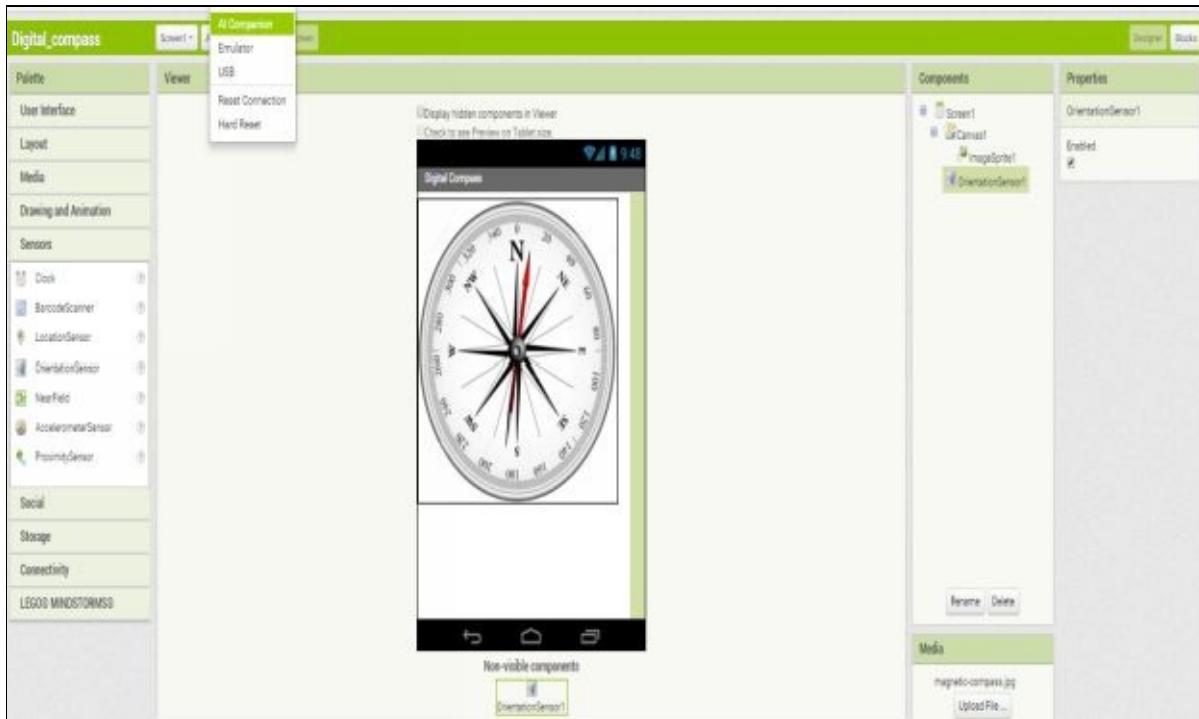

11. Now mouse over on **azimuth** and click on **get azimuth** block.

Attach it to existing **block** as shown below. This block will get the direction to which compass has to rotate.

12. Now Go to Designer and click on Connect and select AI Companion.

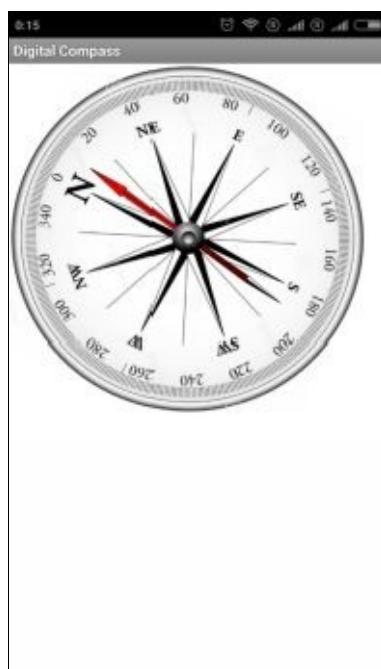

13. Now open [MIT App Inventor 2 Companion](#) in your mobile/Tablet.

And enter the code or scan the QR code from your mobile and click on connect with code.

Note:-Your Mobile/Tablet should be connected to same wi-fi/network to which your computer/Laptop is connected.

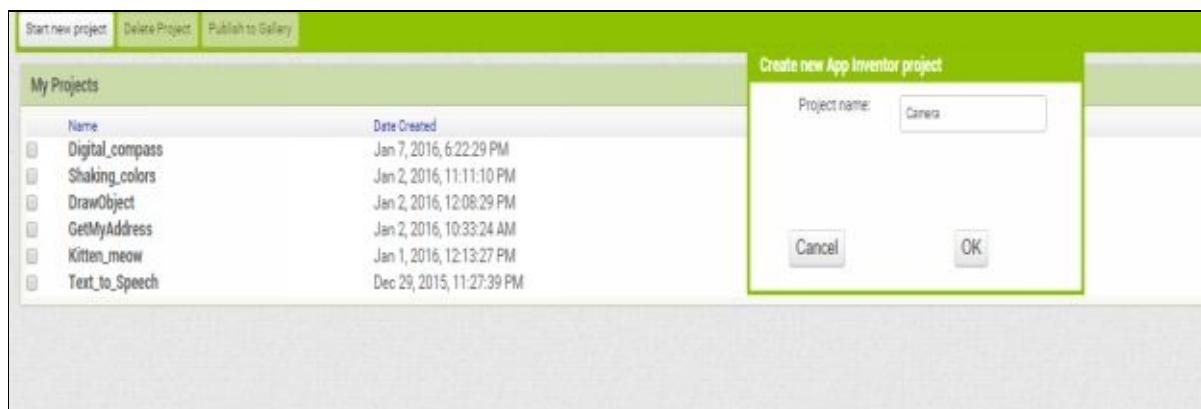

14. Now you should see your app in your phone for live testing. Now move your phone to get the [directions](#).

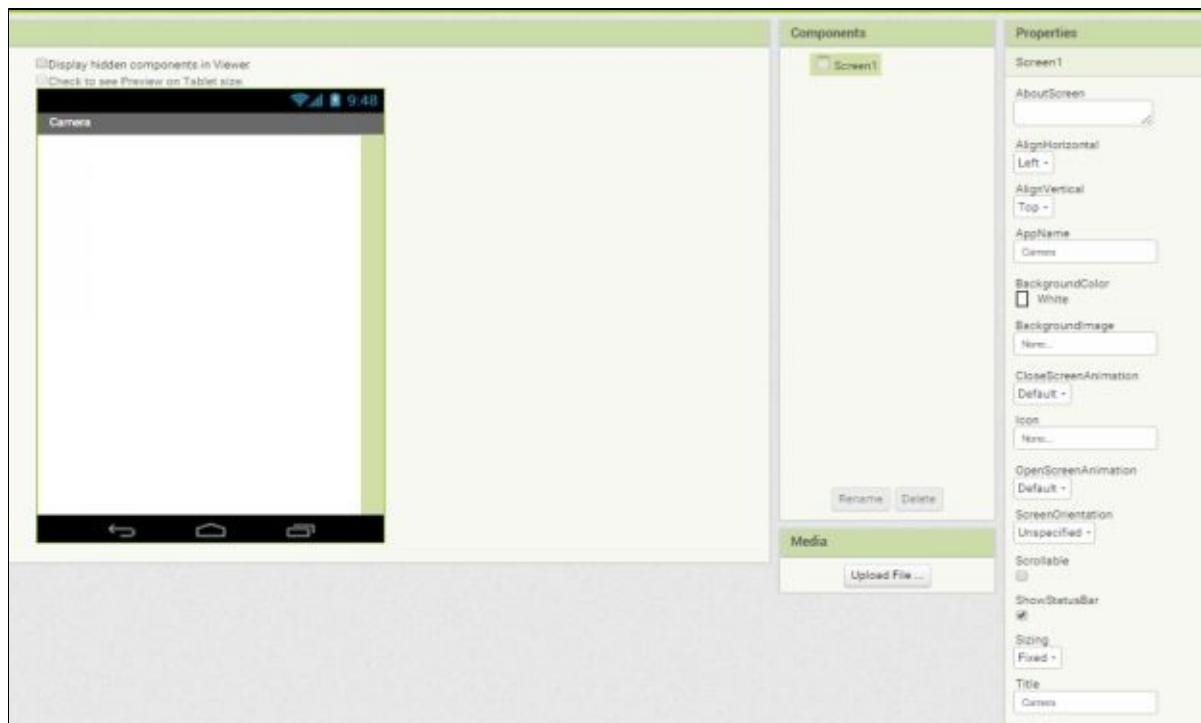

# Chapter 8: Camera App

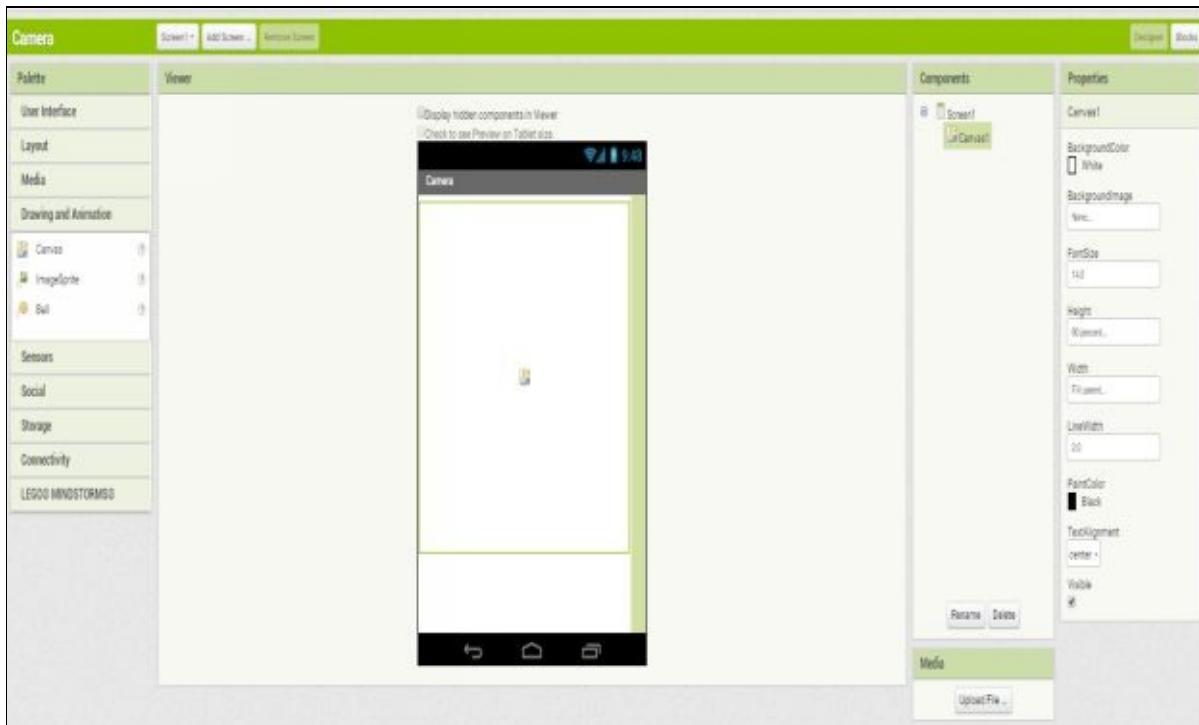

1. Click on **Start new project** and give it name **Camera** and click **OK**.

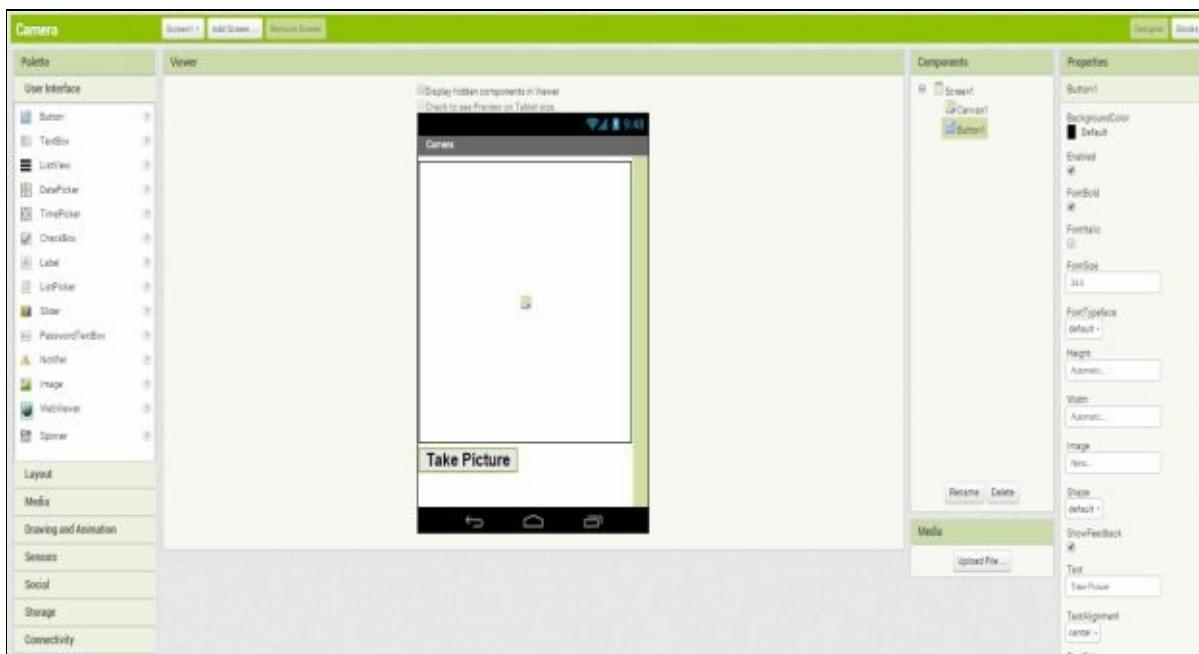

2. Change **Screen1 Title** to **Camera**.

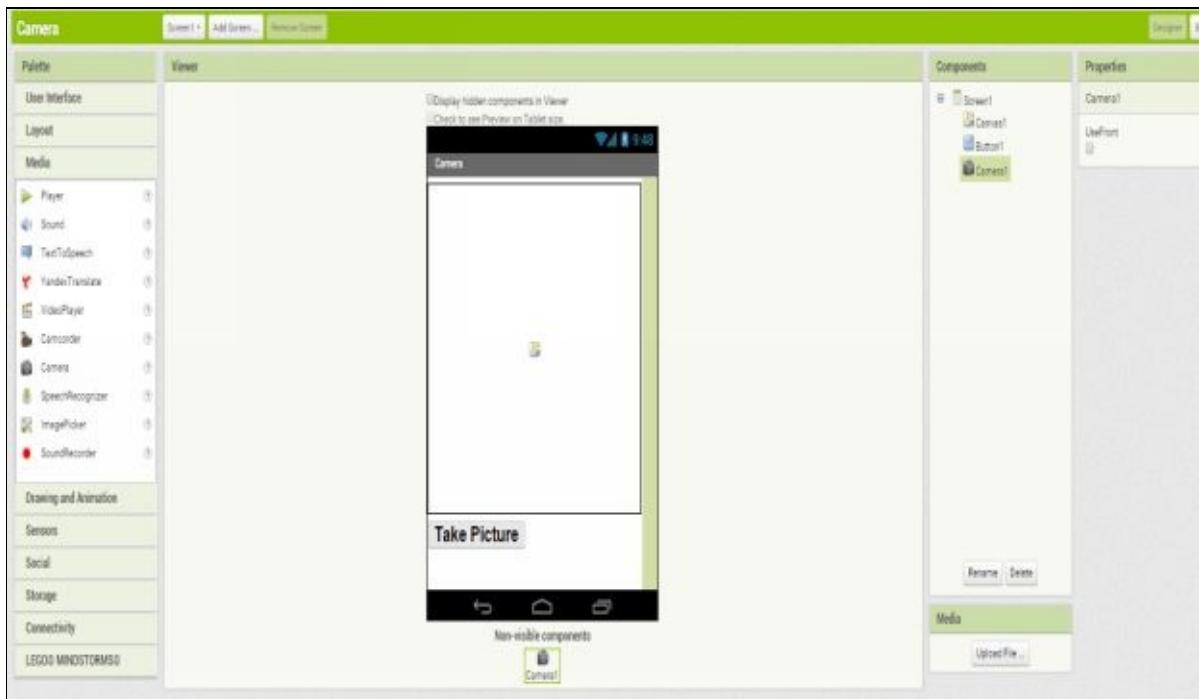

3. Now drag a **Canvas** from **Palette** to **Viewer** screen and set its **Height** to 80 percent and **Width** to **Fill parent**.

4. Now drag a **Button** from **Palette** to **Viewer** screen and set its **Properties** as shown below.

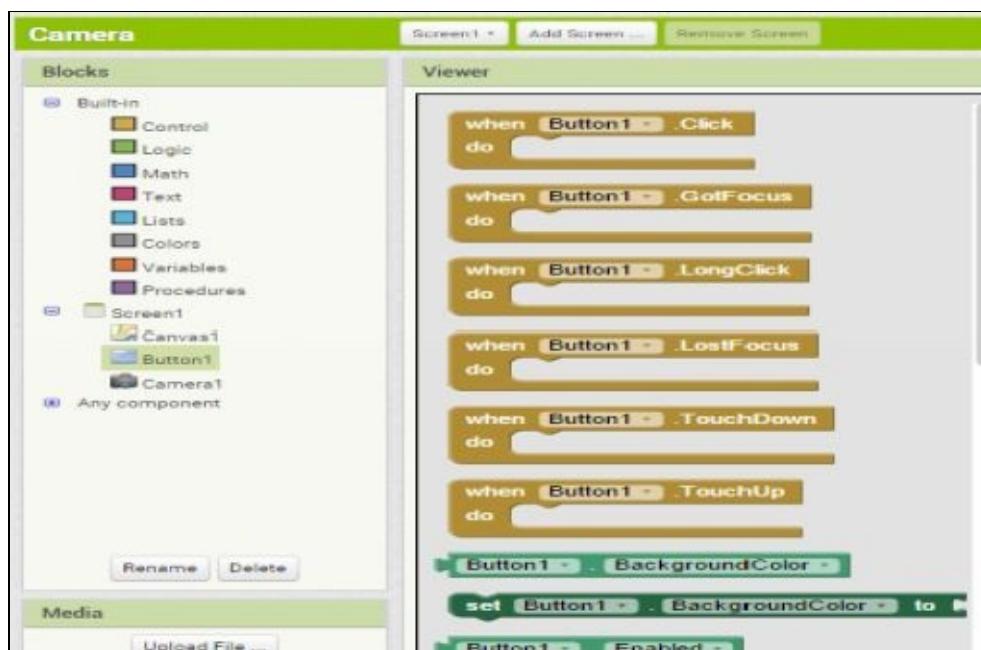

5. Now drag a **Camera** component from **Palette** to **Viewer** screen.

when **Button1** .Click

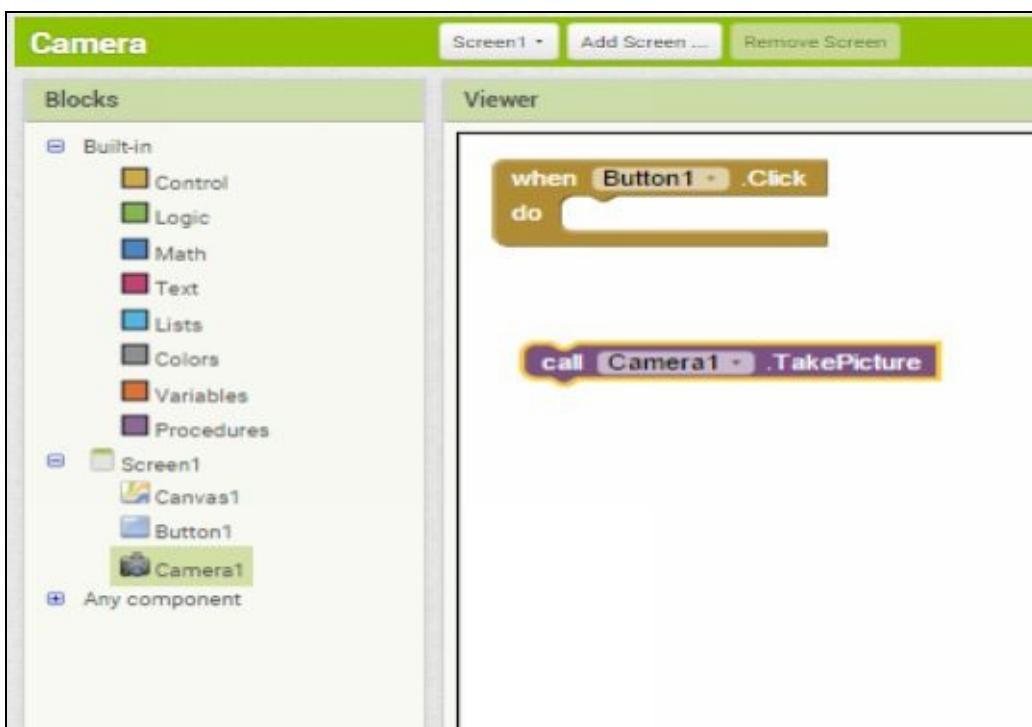

do

6. Now go to **Blocks** and click on **Button1** on left side and select **Block**. This is an event block which will decide what your app will do when this button will be clicked. Here click is an event for **Button1** component.

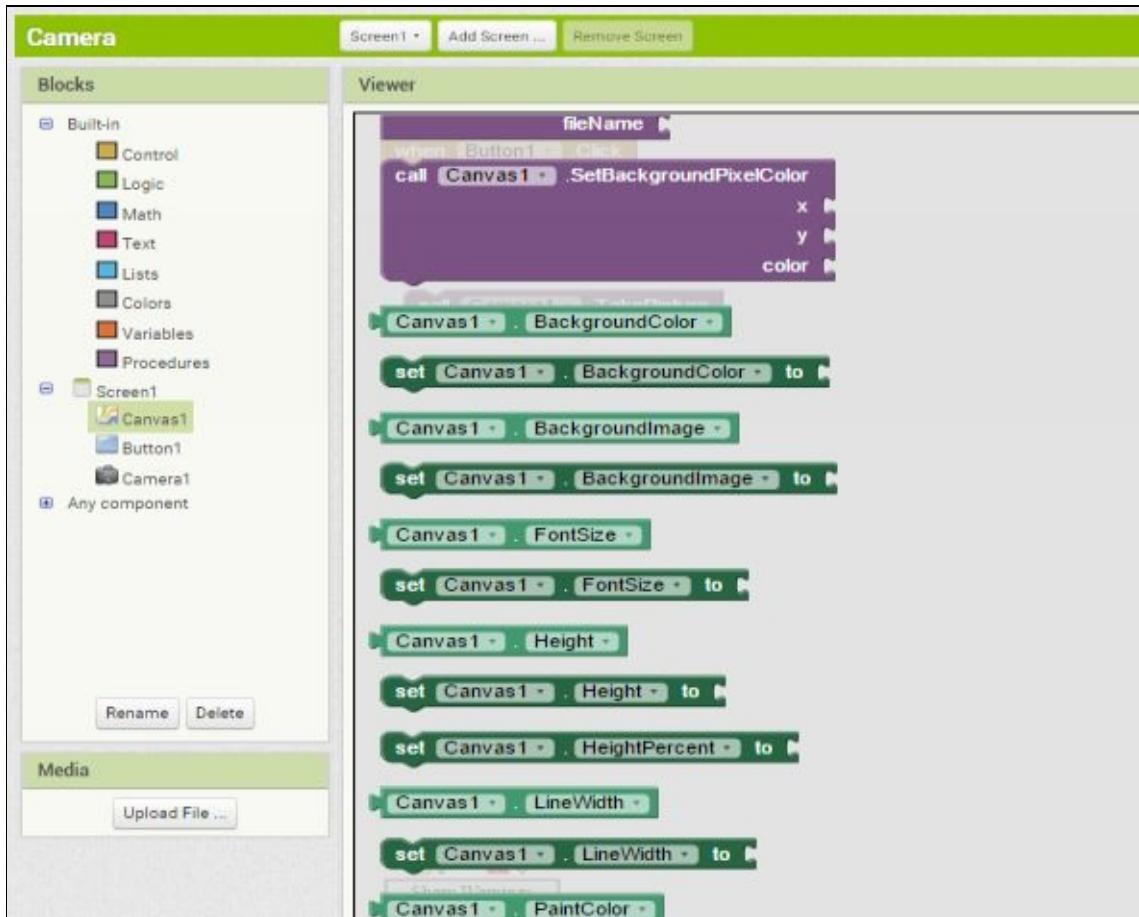

7. Now click on **Camera1** on left side and select **call Camera1 .TakePicture** block. This block will open your device's camera and take picture.

8. Now click on **Canvas1** and select **set Canvas1 . BackgroundImage to** block. This block will set your canvas's background image.

9. Now click on **Camera1** and select **AfterPicture** block. This is an event block which will decide what to do after taking the picture.

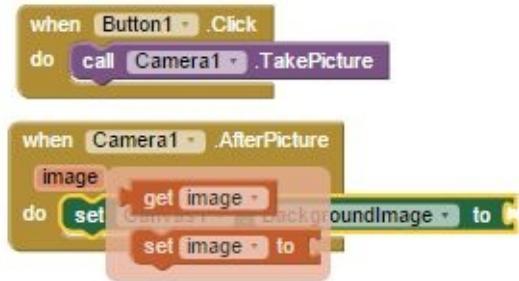

10. Now attach the **blocks** as show below. So that when you click Button1 , your device's camera will open and take picture.

11. Now mouse over on **image** and click on **block**. This block will represent

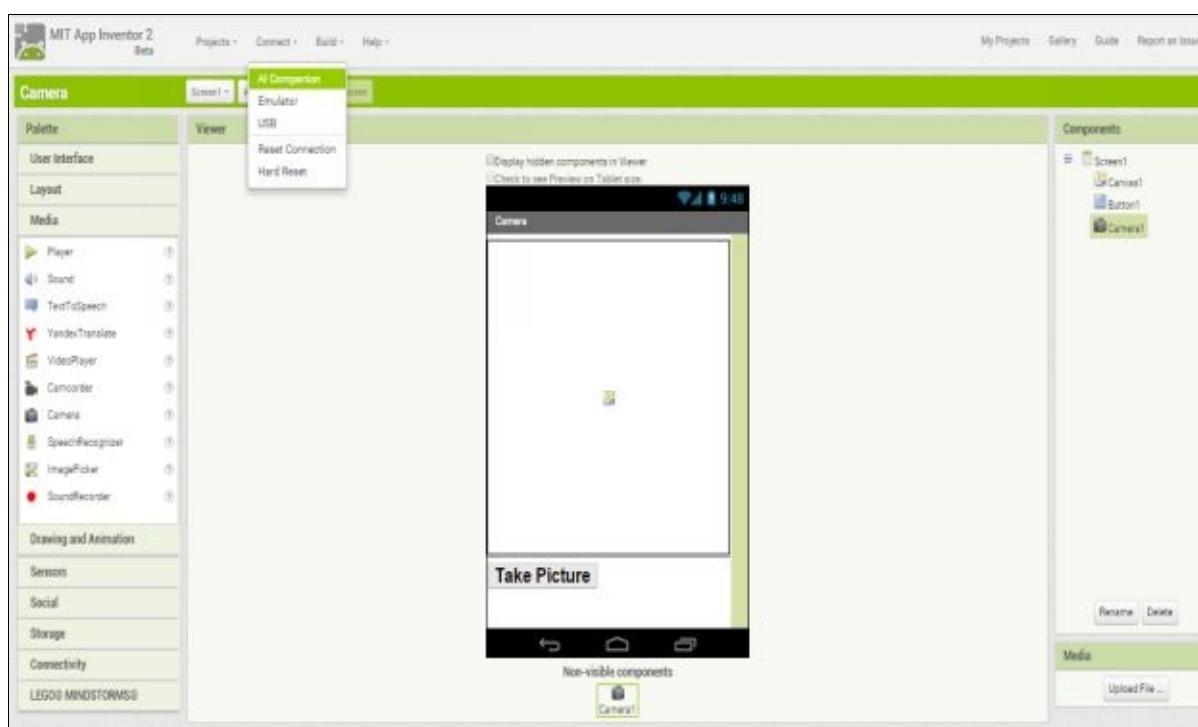

the image taken by your app camera.

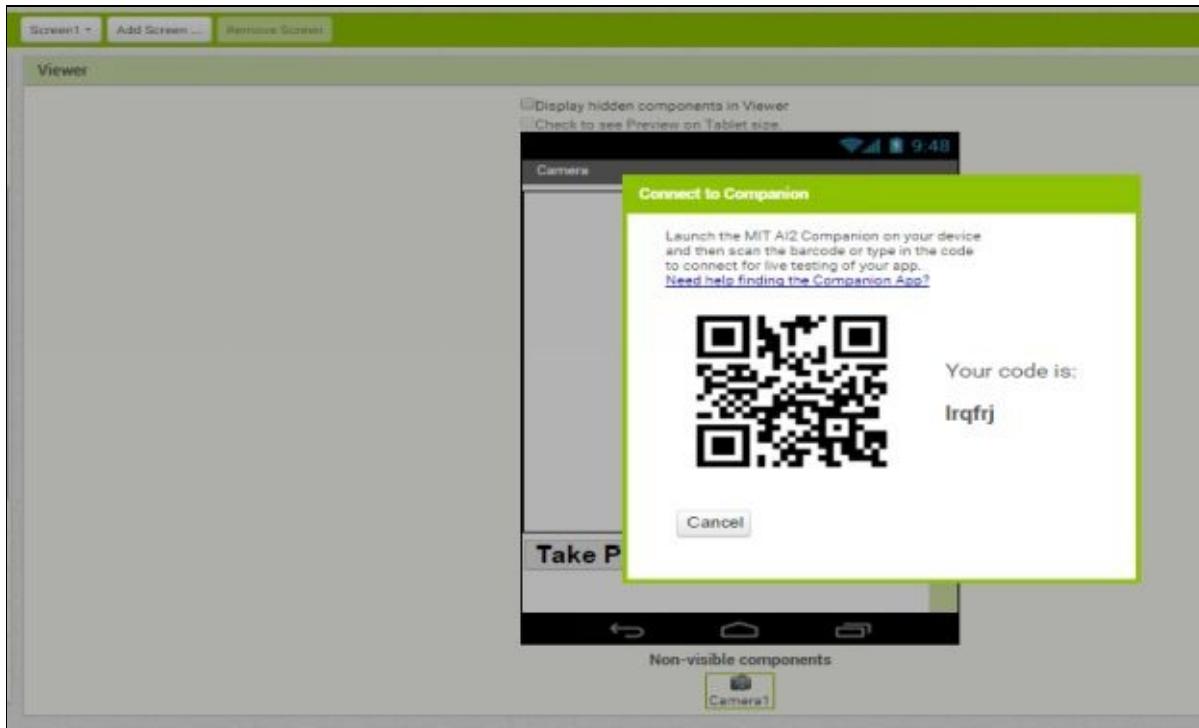

12. Now attach the **blocks** as shown below. So After taking picture your app will set the image as canvas;s background image.

13. Now go to **Designer** and click on **Connect** and then **AI Companion**.

14. Now open MIT App Inventor 2 Companion in your mobile/Tablet.

And enter the code or scan the [QR code](#) from your mobile and click on connect with code.

Note:-Your Mobile/Tablet should be connected to same wi-fi/network to which your computer/Laptop is connected.

15. Now you should see your app in your phone for live testing. Now click on [Take Picture](#) Button and then your device [Camera will open and take picture](#) .Picture will be shown in the [canvas](#) that you have taken.

## Chapter 9: Digital Doodle App (Extending the Camera app)

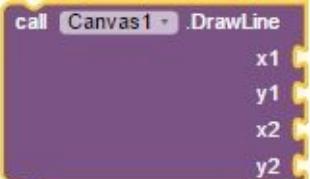

16. Now open the [Camera](#) app and go to [blocks](#) and click on [Canvas1](#) on left side and

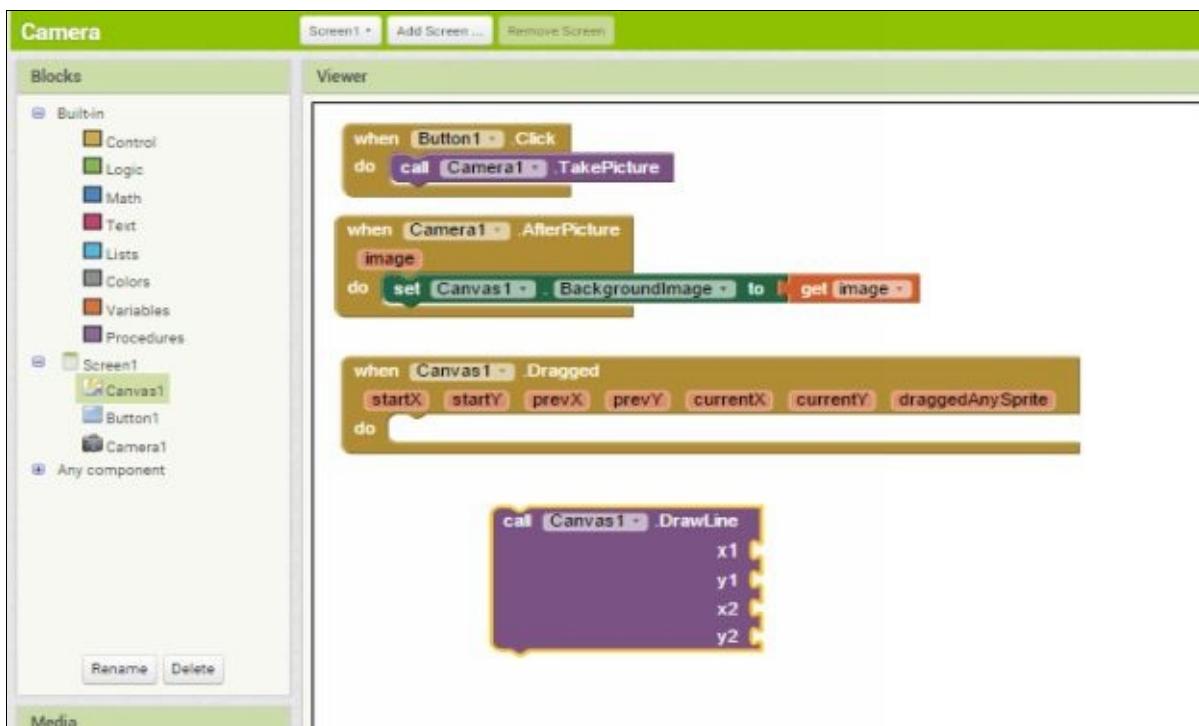

click on [block](#). This block will

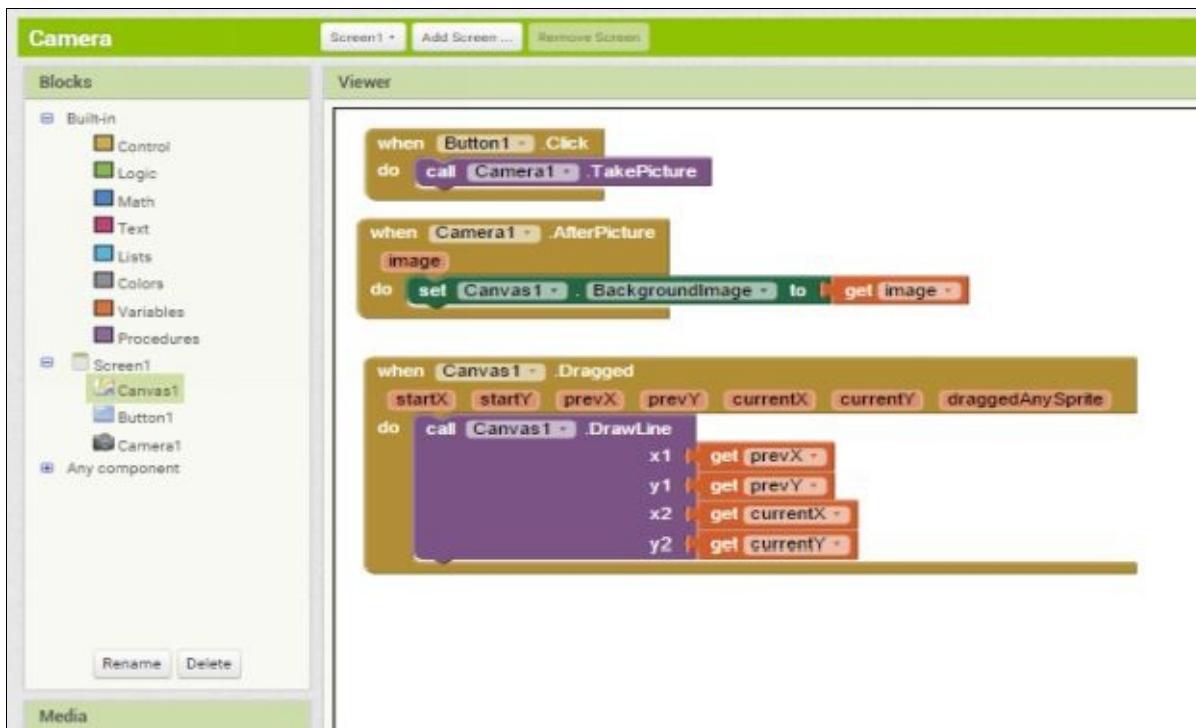

identify dragging activity on your canvas and decide what to do when dragged.

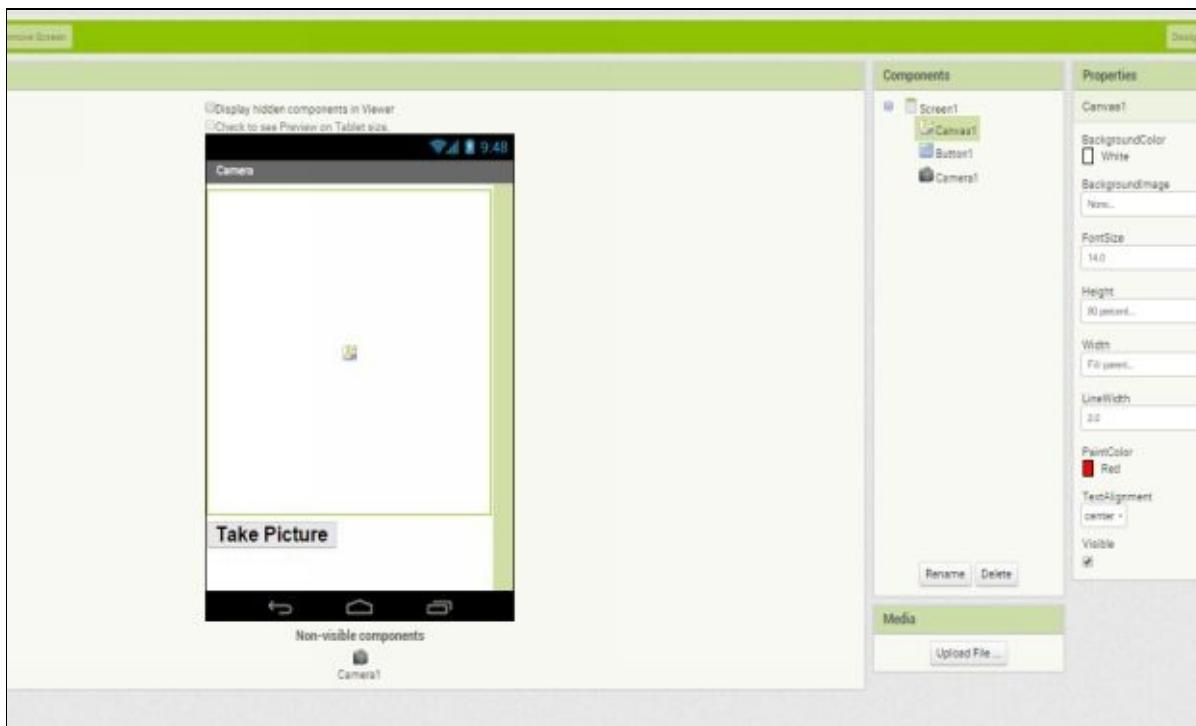

17. Now click on **Canvas1** on left side and click on  block. This block will draw a line on your canvas. A line has starting point(x1,y1) and ending point(x2,y2).

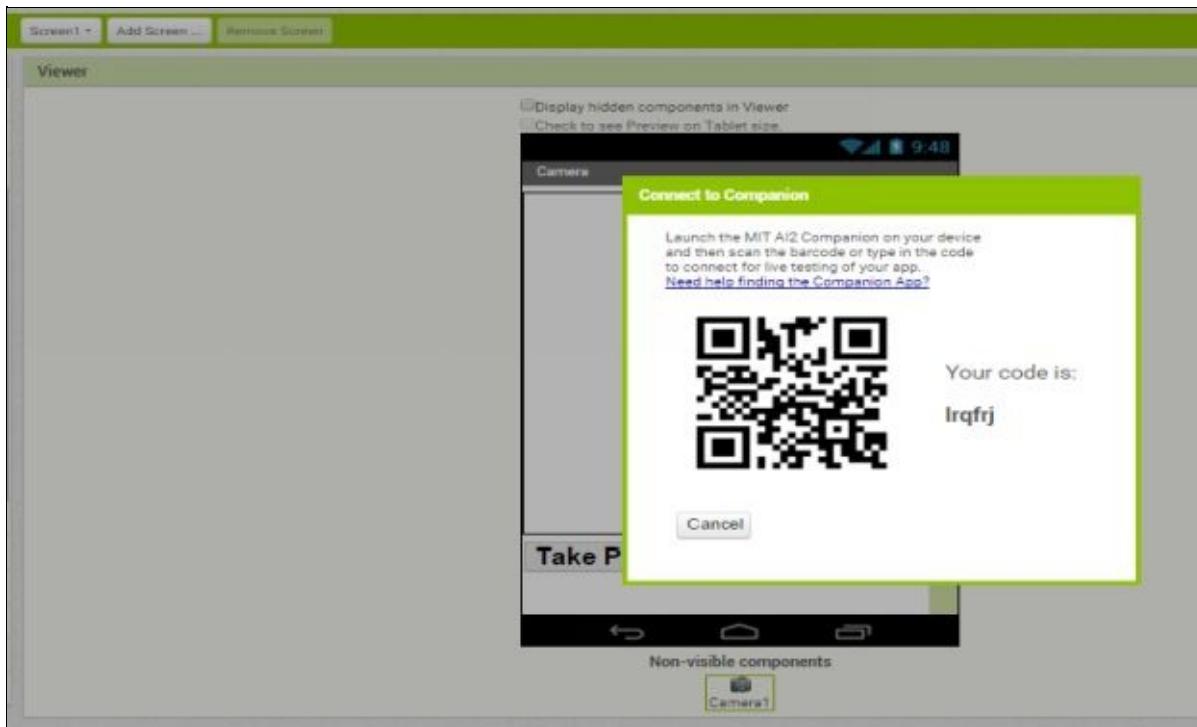

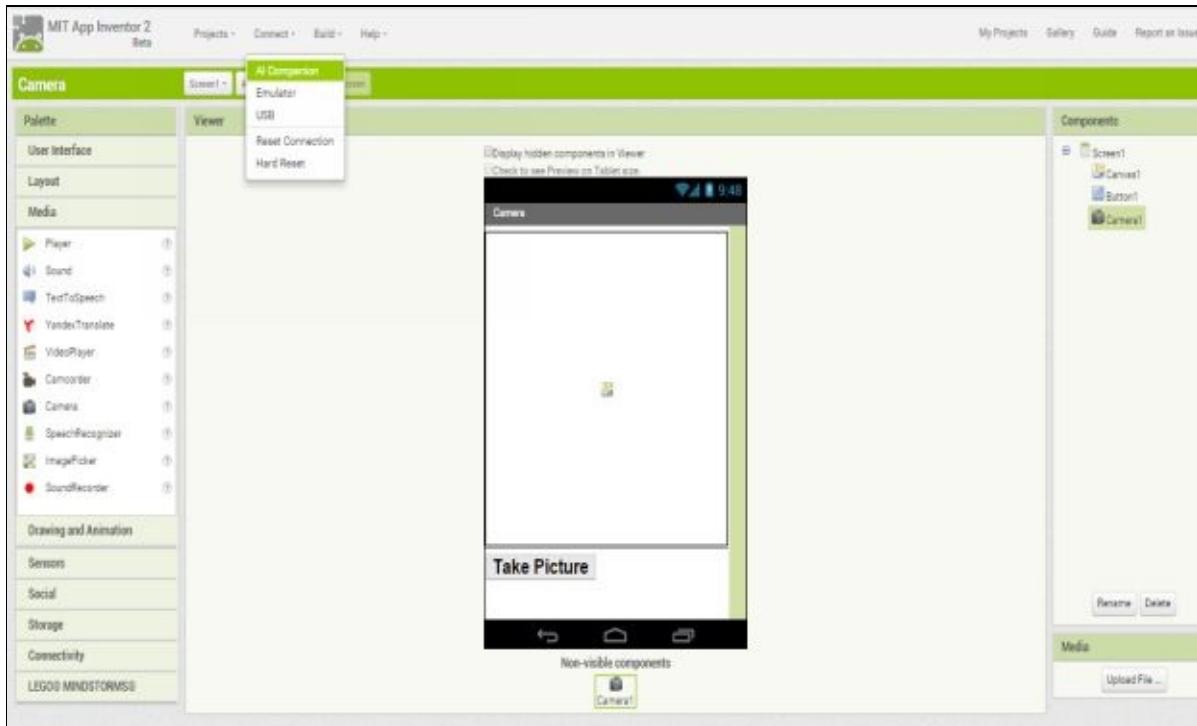

18. Now connect the **blocks** as shown below. This logic will draw a line on canvas where **prevX** and **prevY** are the co-ordinates of starting point of line and **currentX** and **currentY** are the co-ordinates of end point of line.

19. Now go to **Designer** and change **PaintColor** for **Canvas1** Component in **Properties**.

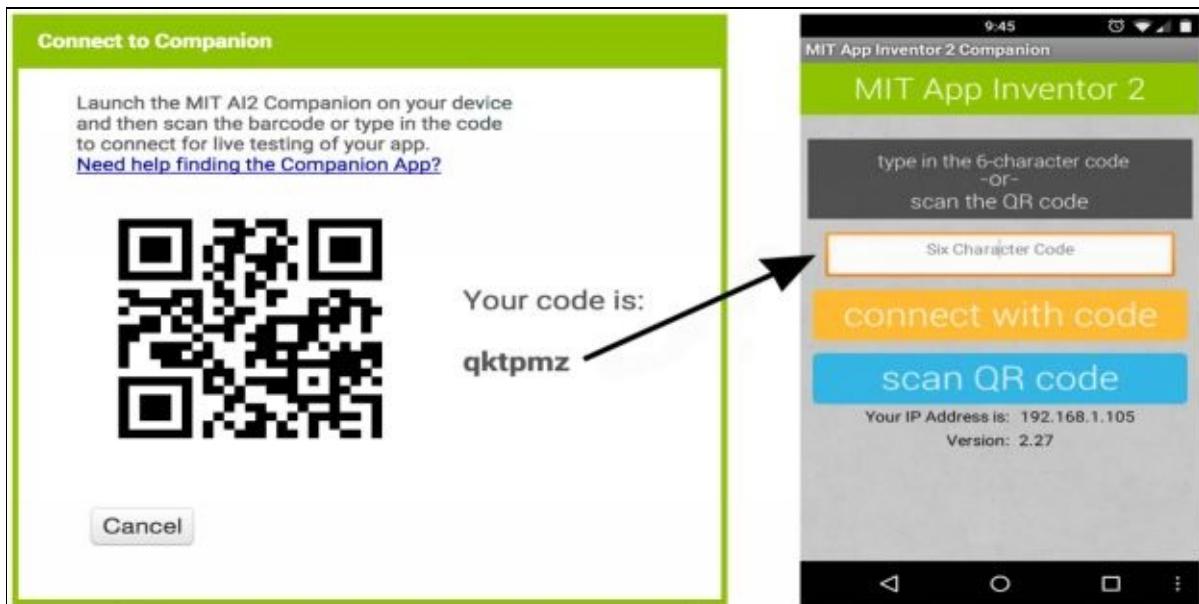

20. Click on **Connect** and then **AI Companion**.

21. Now open [MIT App Inventor 2 Companion](#) in your mobile/Tablet.

And enter the code or scan the [QR code](#) from your mobile and click on connect with code.

Note:-Your Mobile/Tablet should be connected to same wi-fi/network to which your computer/Laptop is connected.

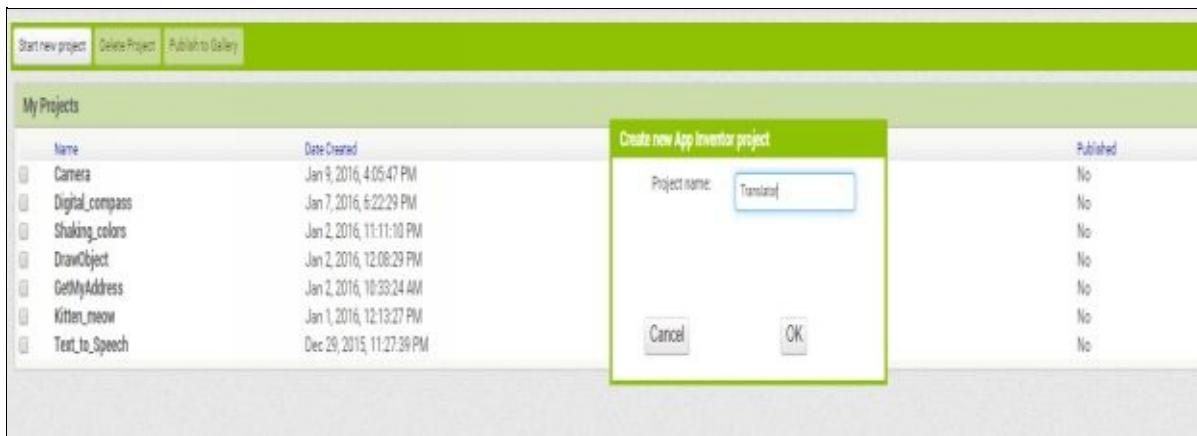

22. Now you should see your app in your phone for live testing. Now click on [Take Picture](#) Button and then [Camera will open and take picture](#). Picture will be shown in the canvas that you have taken. Now here [you can draw on your taken picture](#).

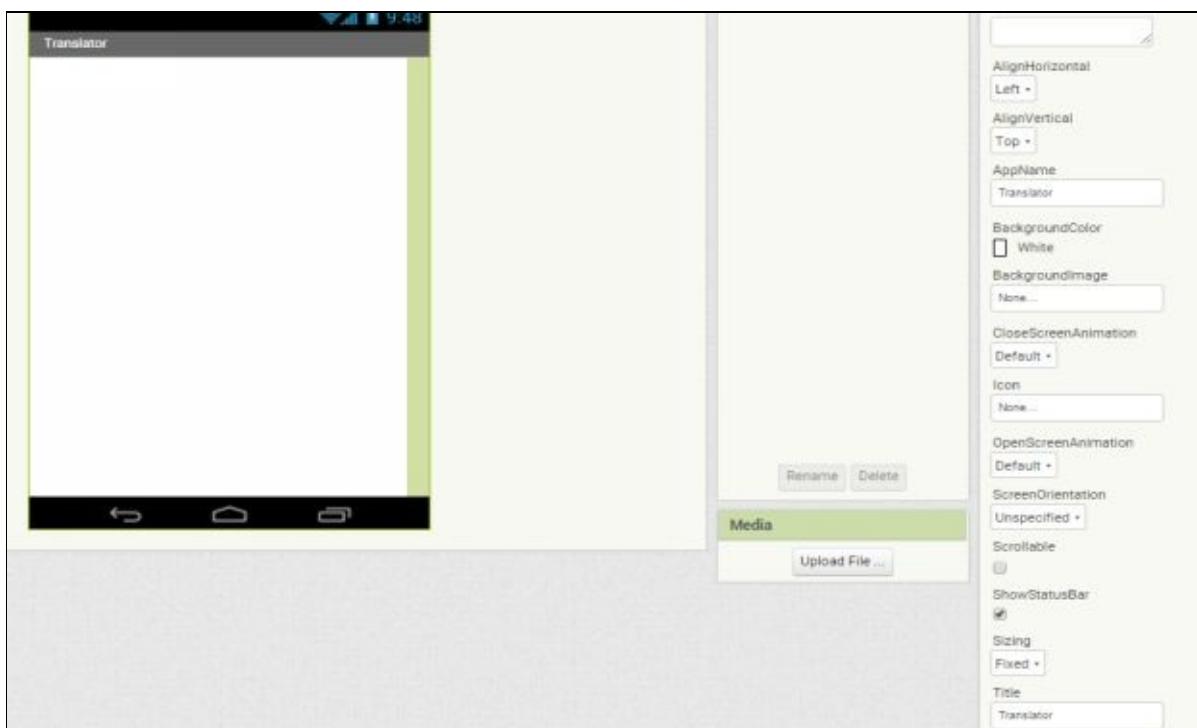

# Chapter 10: Translator App

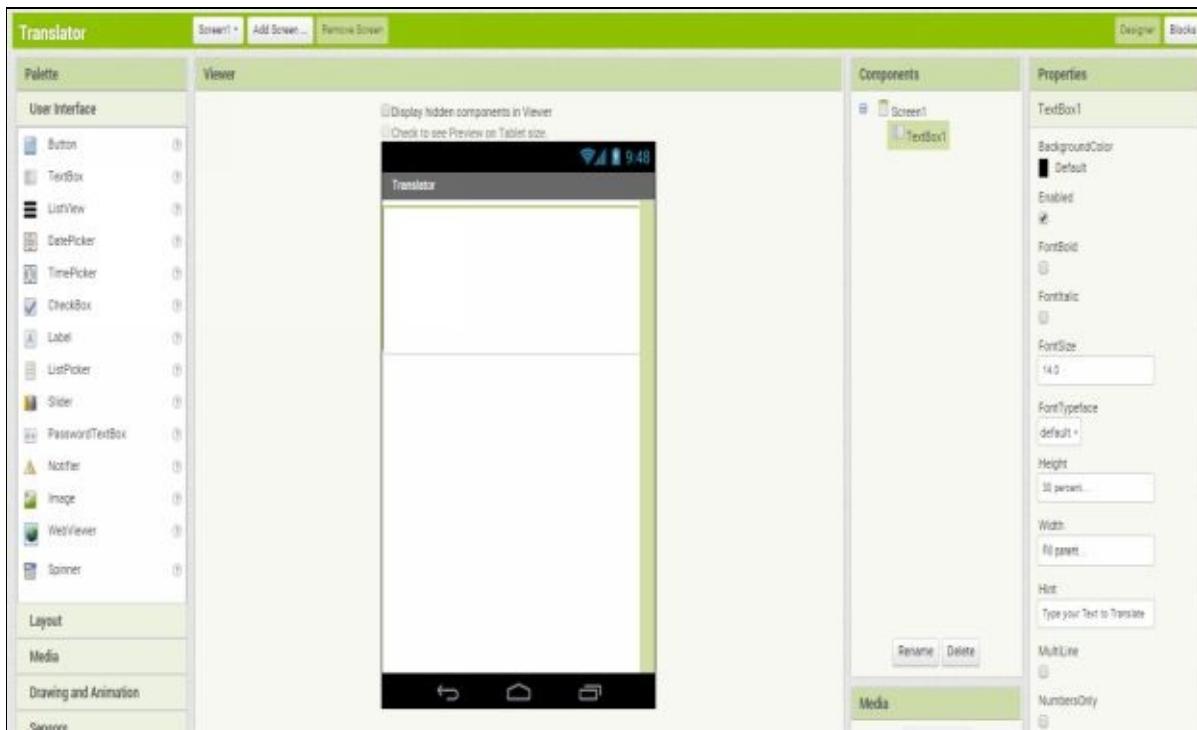

1. Click on **Start new project** and give it name **Translator** and click **OK**.

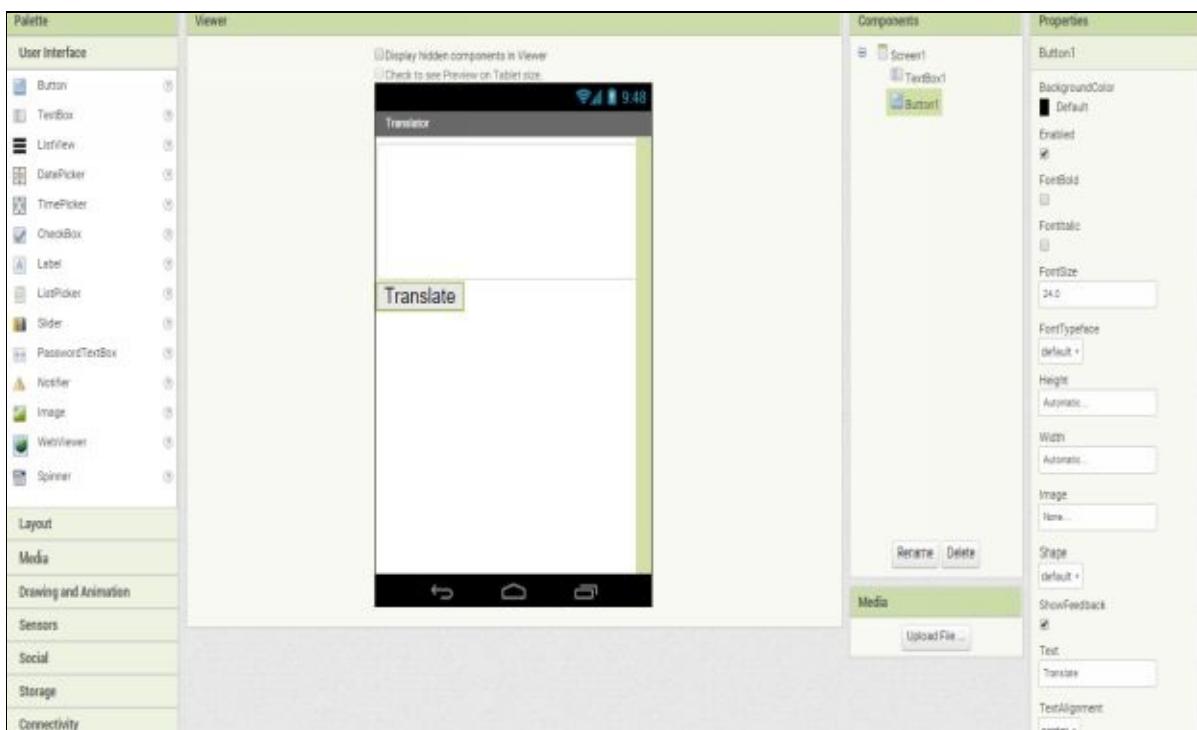

2. Change **Screen1 Title** to **Translator**.

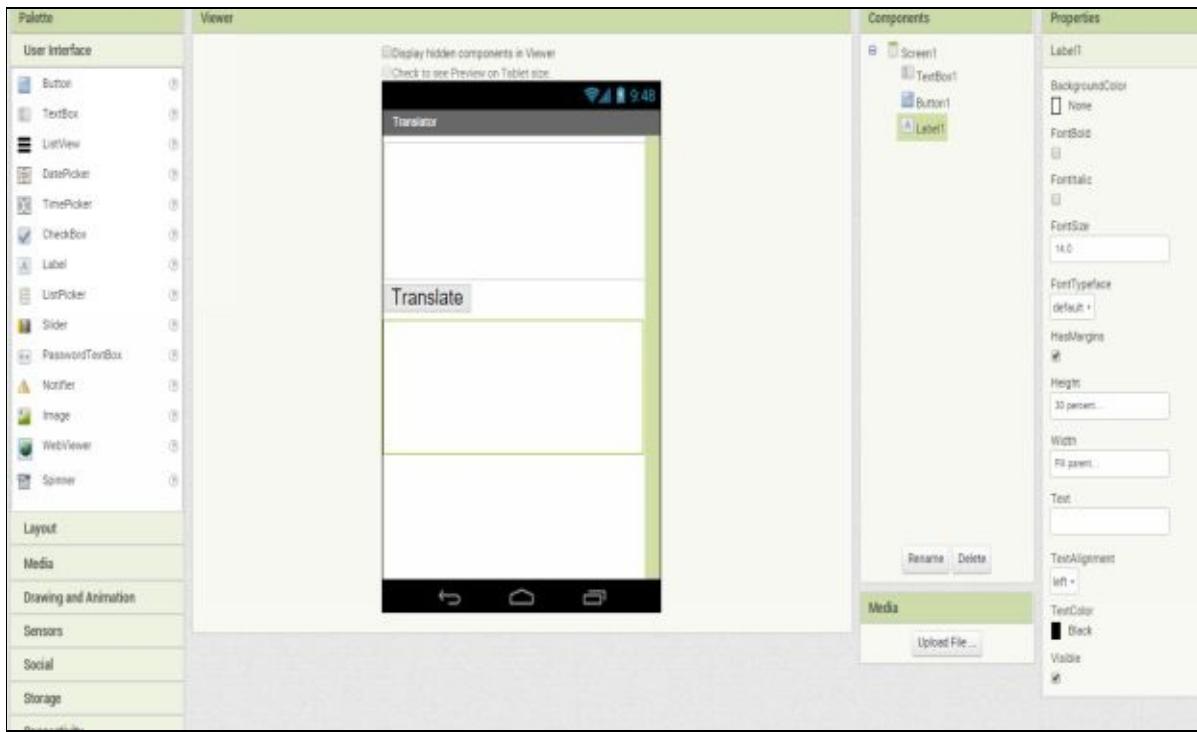

3. Drag a **TextBox** from **Palette** to **Viewer** screen and set its **Properties** as show below.

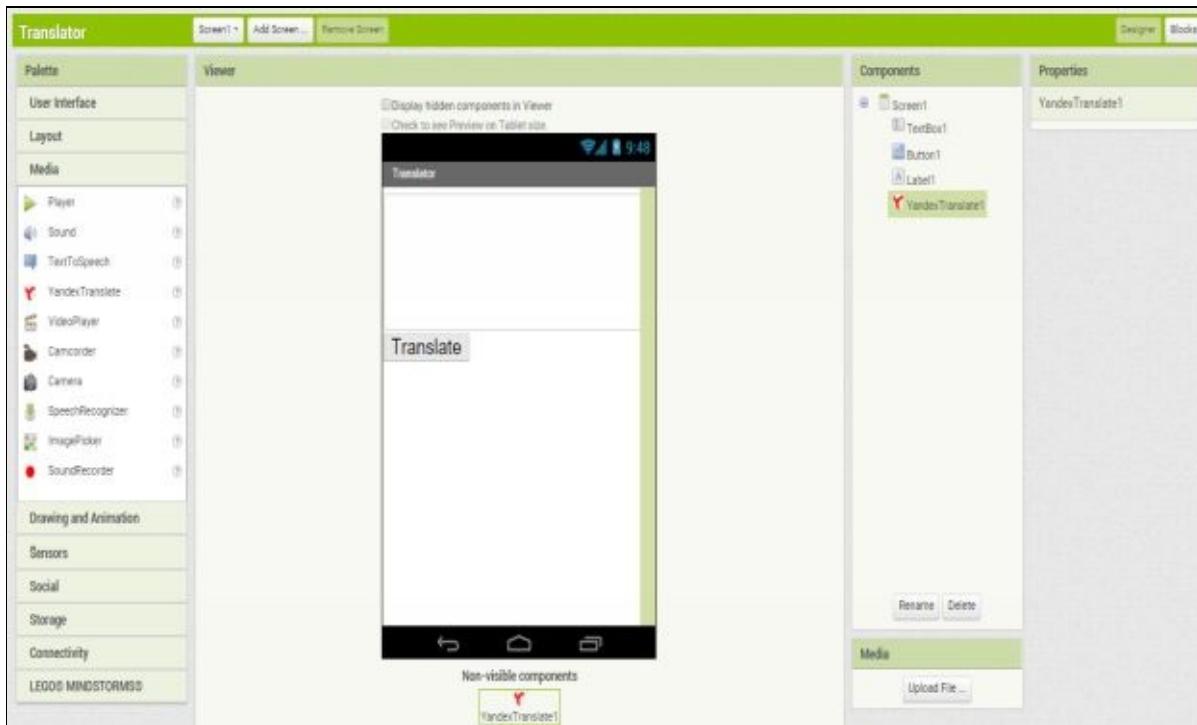

4. Now drag a **Button** component from **Palette** to **Viewer** screen and change its **Text** to **Translate** and **FontSize** to **24.0**.

5. Now drag a **Label** from **Palette** to **Viewer** screen and set its **Properties** as shown below.

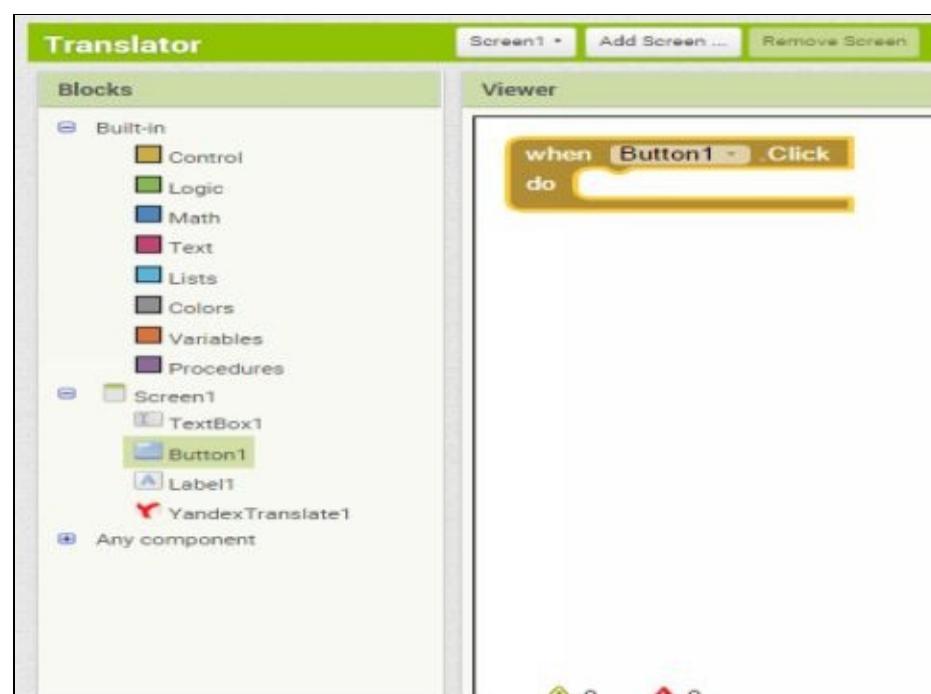

6. Now Drag a YandexTranslate component from **Palette** to **Viewer** screen. It's a non-visible component.

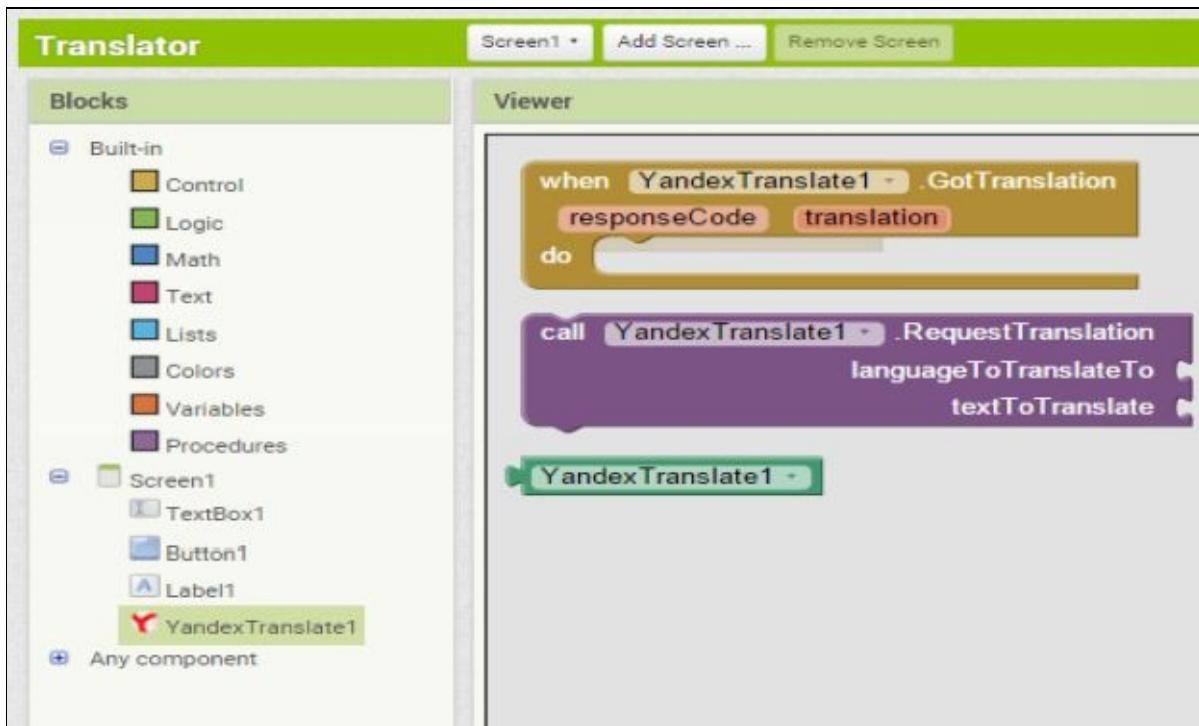

7. Now go to **blocks** and click on **Button1** component on left side and click on **block**. This is an event block which will decide what your app will do when this button will be clicked. Here click is an event for Button1 component.

```
when Button1 . Click
do
```

```
call [YandexTranslate1 v].RequestTranslation
languageToTranslateTo
textToTranslate
```

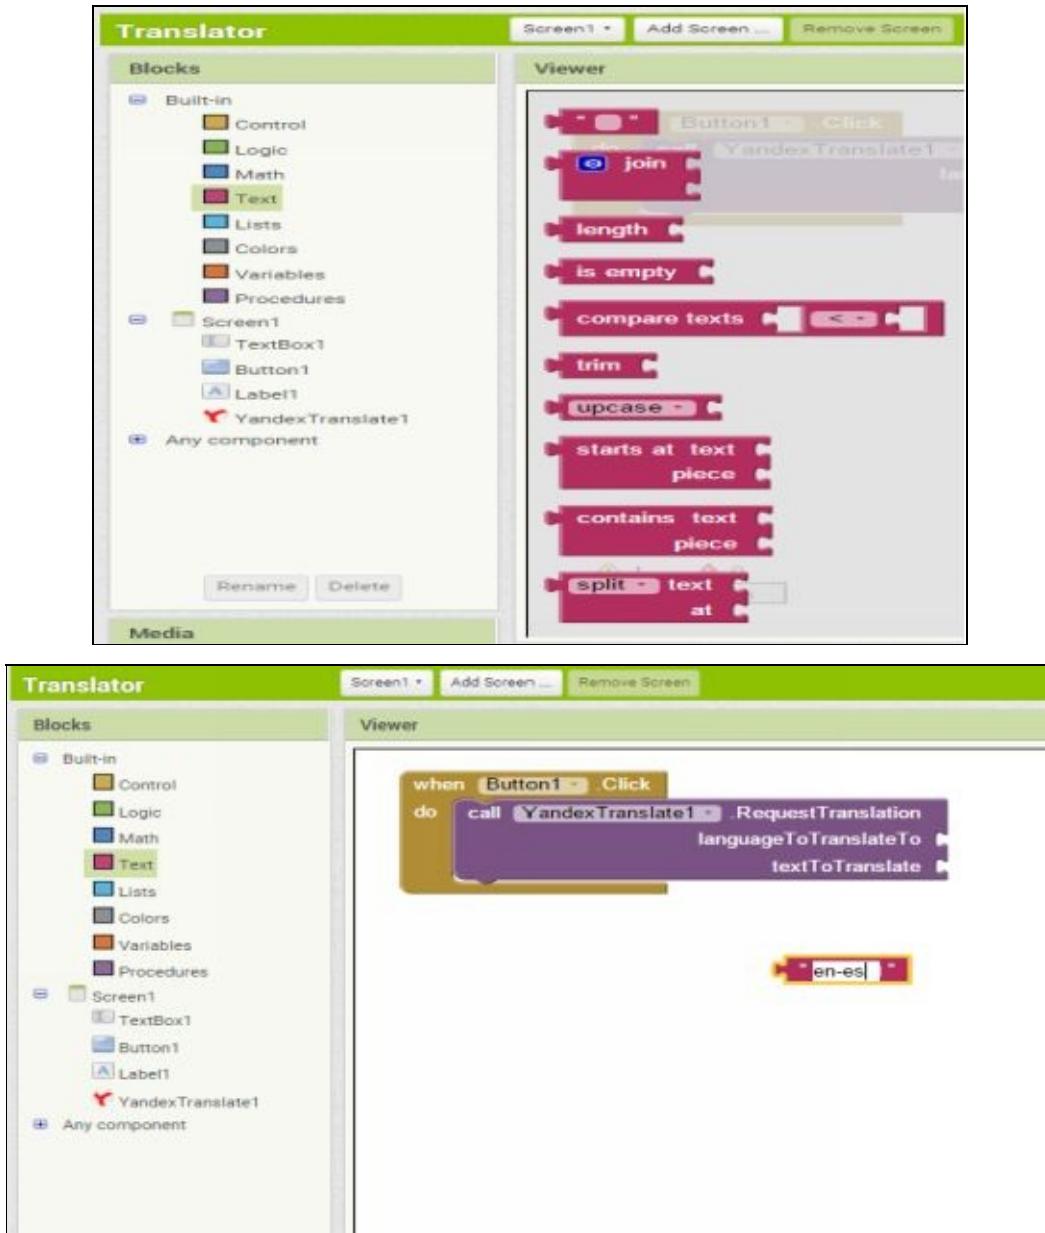

- Now click on **YandexTranslate1** component and click on **block**. This block will translate the Text.

9. Now attach these **blocks** as show below. So that when you click Button1 your app will translate some text.

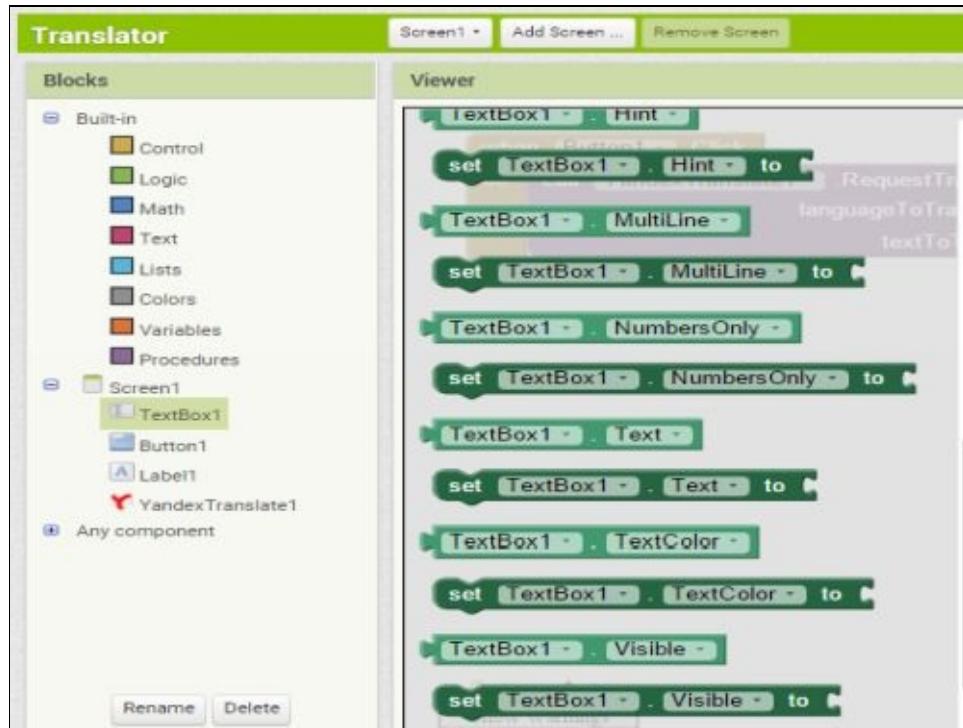

10. Click on Text under **Built-in** and click on block and type **en-es** in the block that will tell the **translate engine** to take the text in **English** and translate to **Spanish**.

11. Now attach the **blocks** as show below. This will tell your app to translate from English language to Spanish when Button1 is clicked.

12. Click on **TextBox1** Component and scroll down to select **TextBox1 . Text** block.

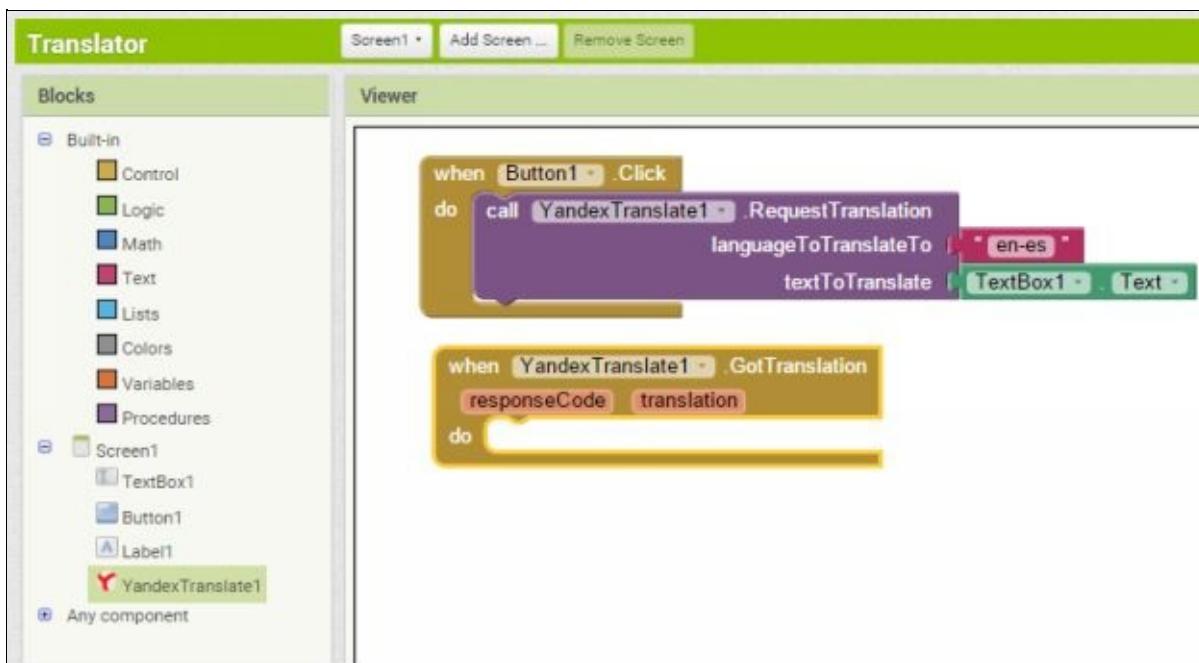

13. Attach the **blocks** as show below. So when Button1 is clicked your app will translate the text which is there in TextBox1.

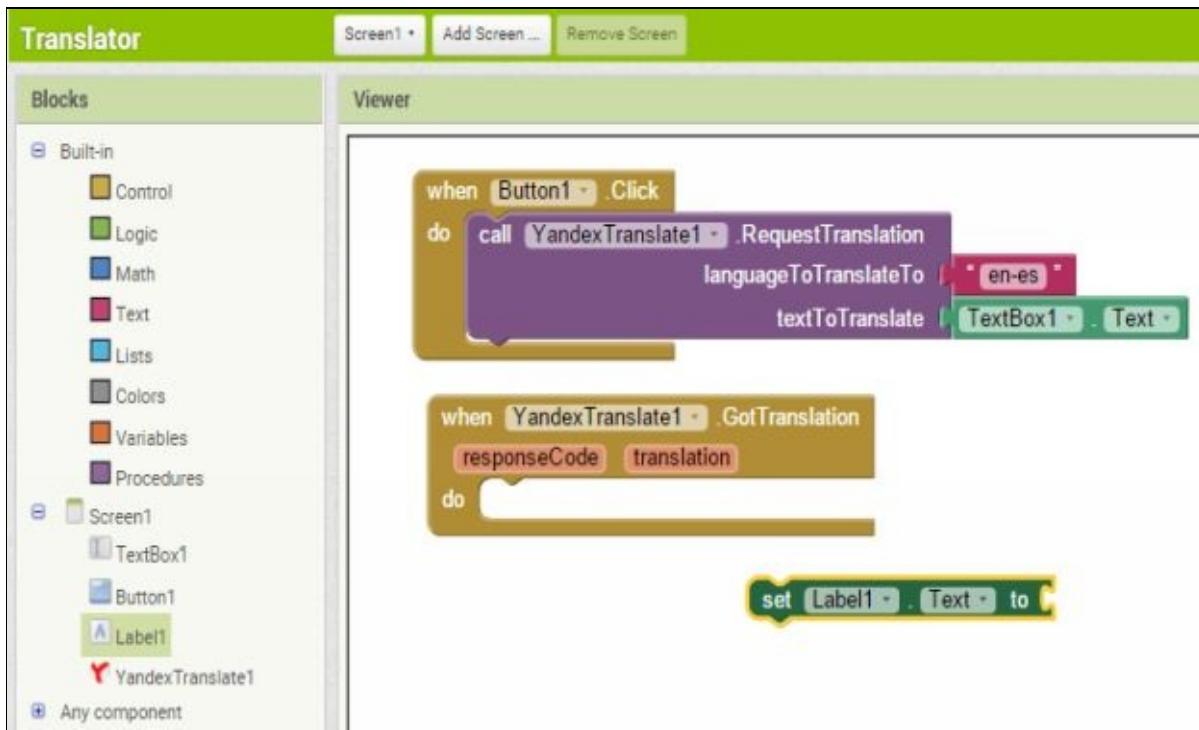

```
when Button1 .Click
do call YandexTranslate1 .RequestTranslation
languageToTranslateTo "en-es"
textToTranslate TextBox1 . Text
```

```
when YandexTranslate1 .GotTranslation
responseCode translation
do [ ]
```

14. Now click on **YandexTranslate1** and click on **block**. This will decide what to do when Translation is completed.

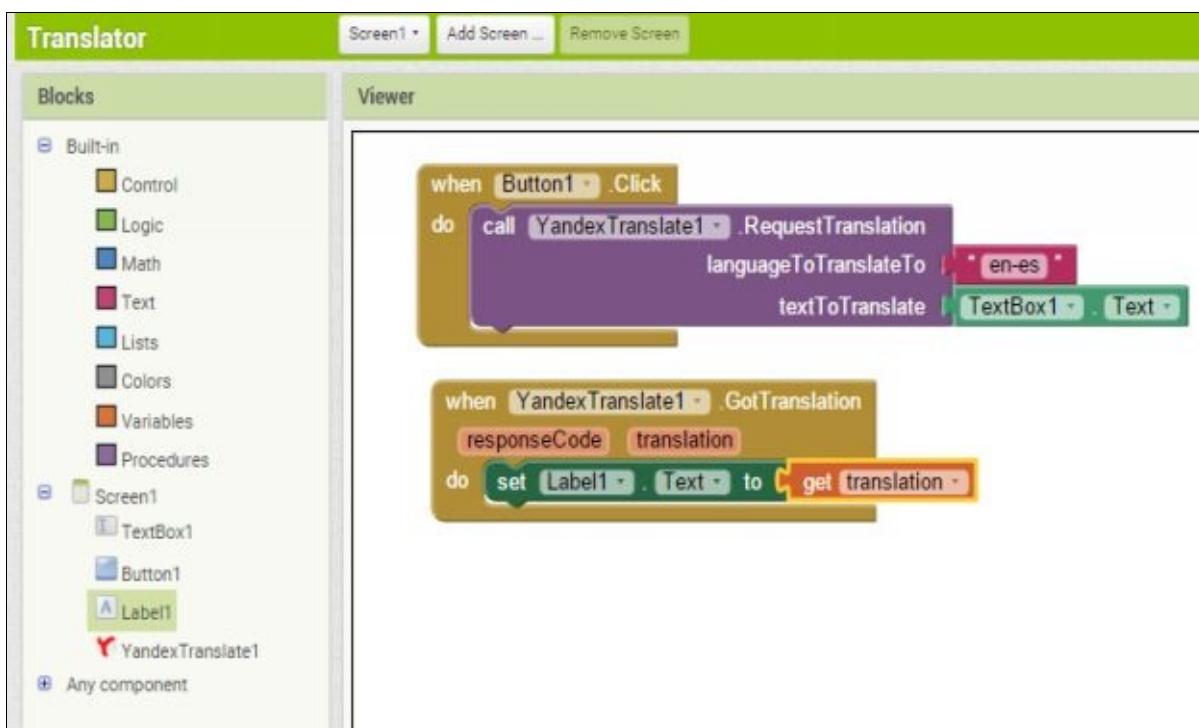

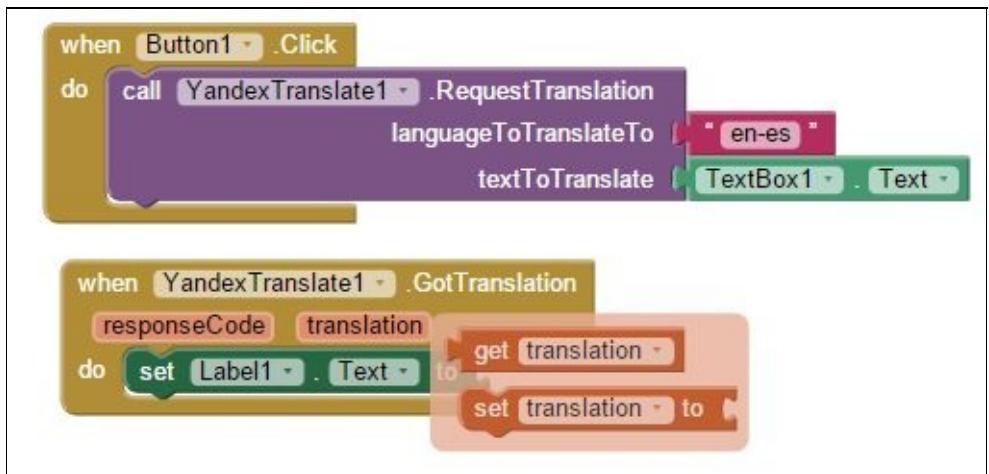

15. Now click on [Label1](#) component and select block.

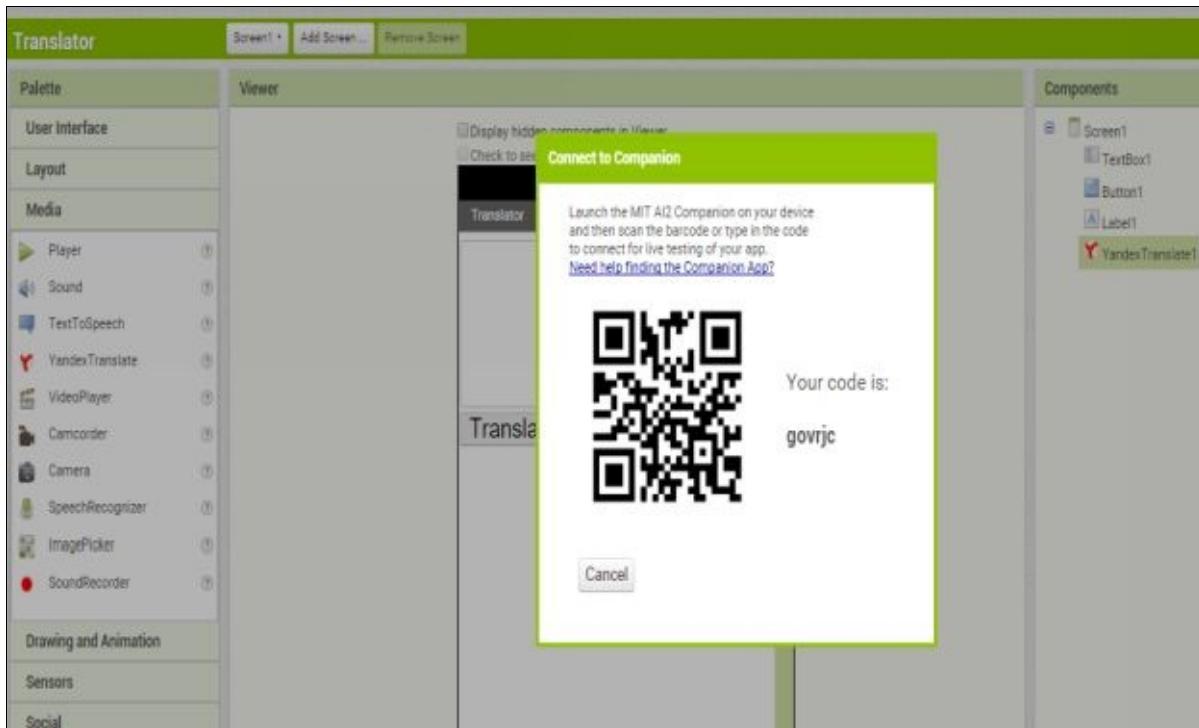

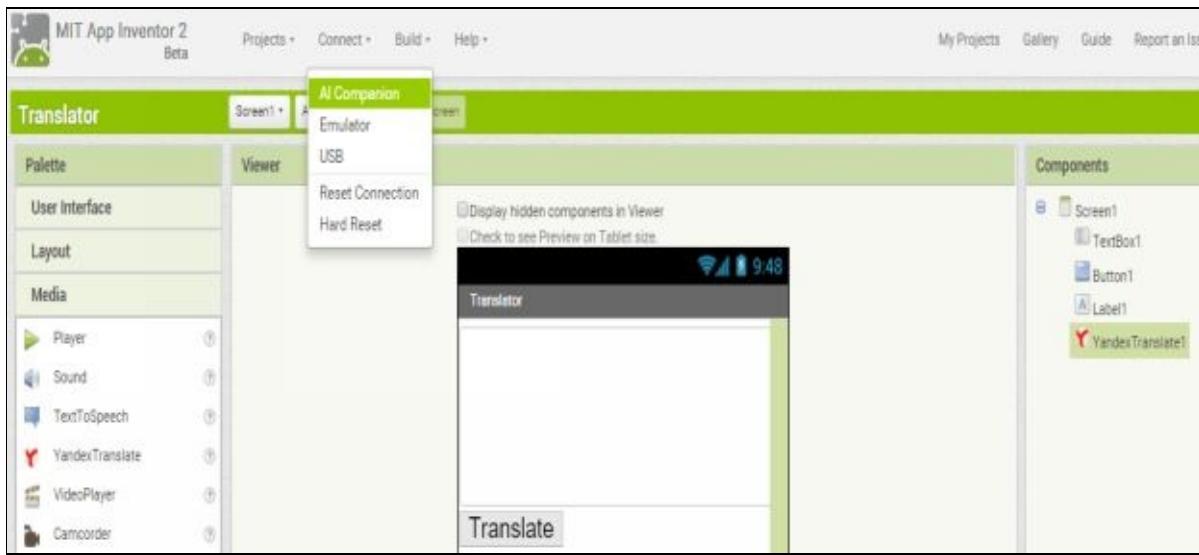

16. Attach the **blocks** as show below.

17. Now mouse over on **translation** and select **get translation** block and attach the **blocks** as show below. So when translation is complete your app will set Label's Text as Translated text.

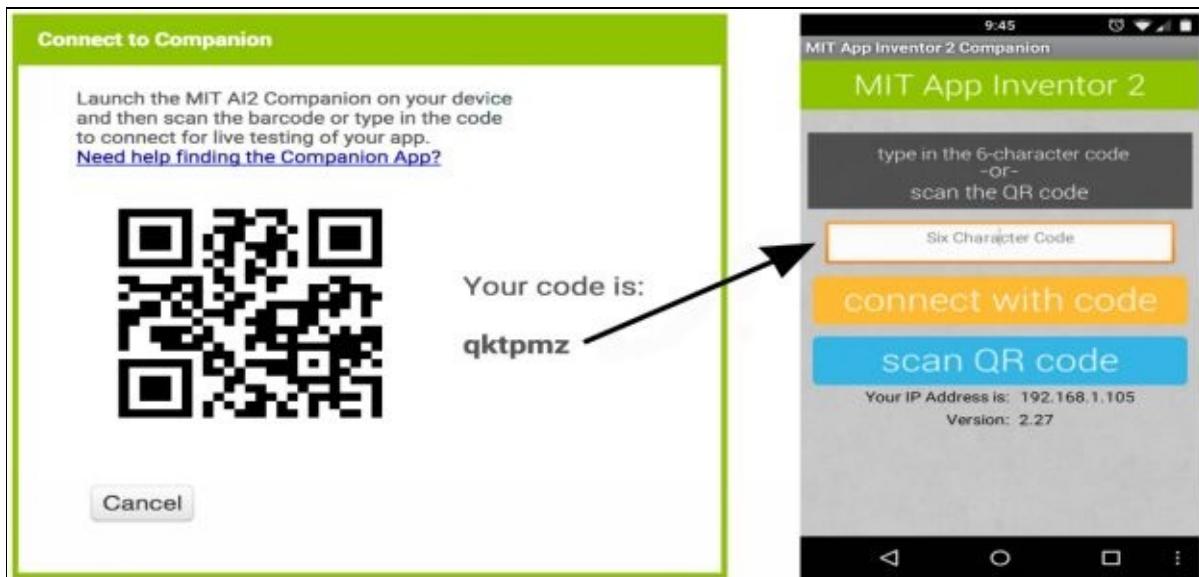

18. Now go to [Designer](#) and click on [Connect-> AI Companion](#).

19. Now open **MIT App Inventor 2 Companion** in your mobile/Tablet.

And enter the code or scan the **QR code** from your mobile and click on connect with code.

Note:-Your Mobile/Tablet should be connected to same wi-fi/network to which your computer/Laptop is connected.

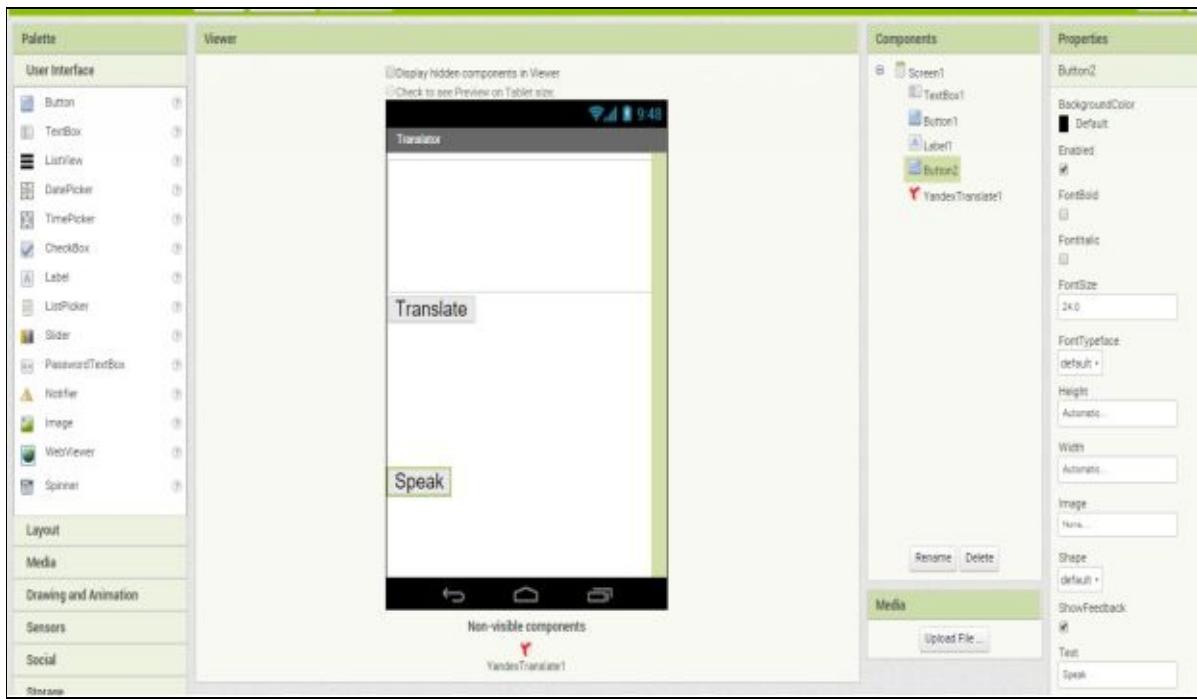

20. Now you should see your app in your phone for live testing. Type anything in the textbox and click on Translate button and the Spanish text will be shown below Translate Button.

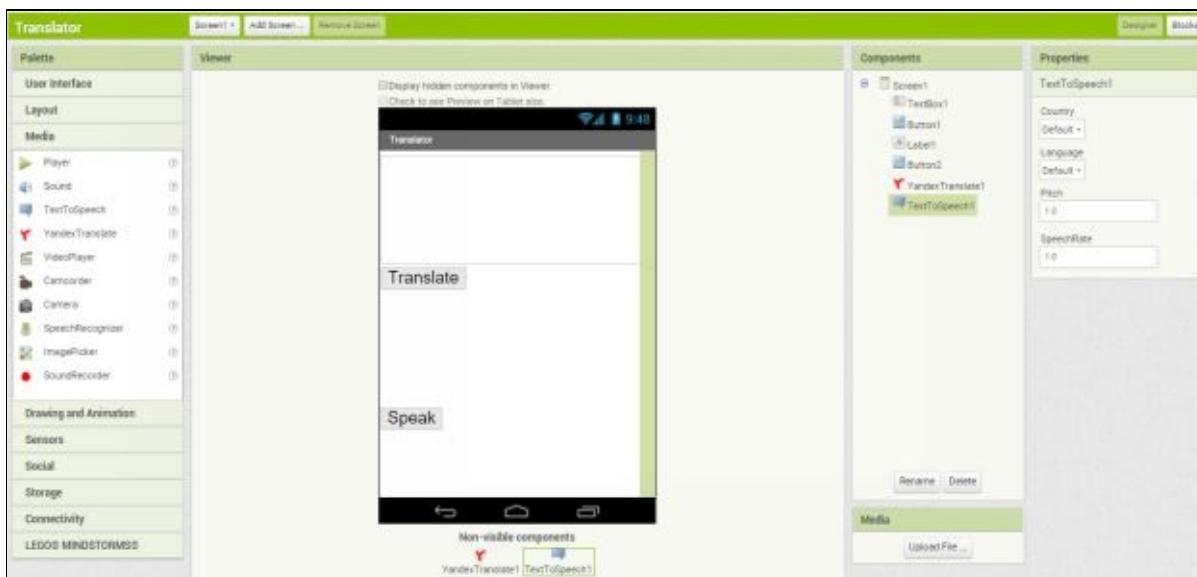

## Chapter 11: Translator App (Extended)

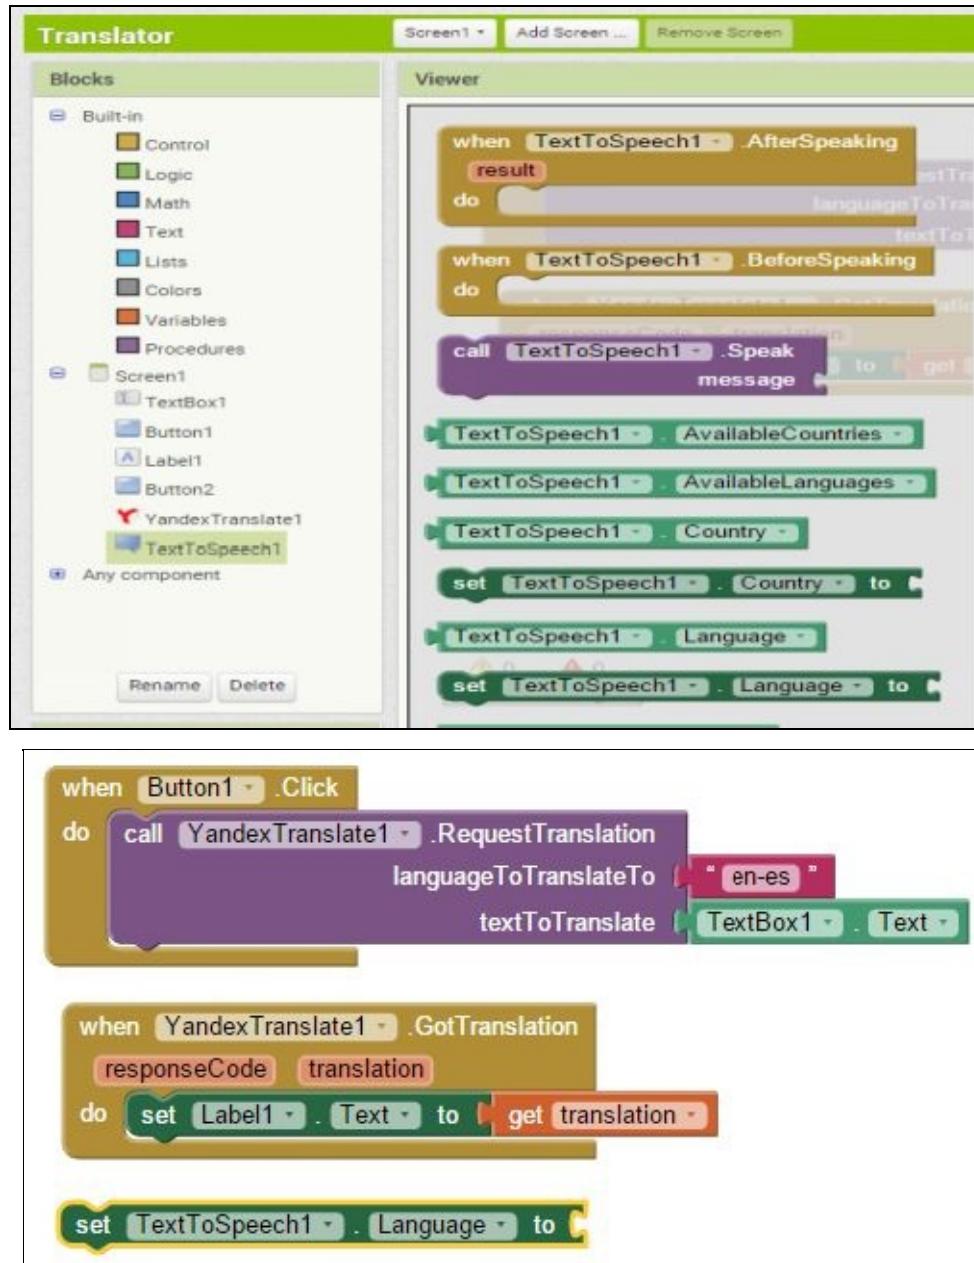

21. Open your **Translator** app and Drag a **Button** from **Palette** to **Viewer** screen and set its **Properties** as shown below.

22. Now drag a **TextToSpeech** component from **Palette** to **Viewer** screen. It's a non-visible component.

23. Now go to **blocks** and click on **TextToSpeech** and click on **block**. This block will make your app speak the text in a particular language.

24. Now click on **Button2** and click on **when Button2 .Click** block. This block will decide what to do when Button2 is clicked.

25. Now attach the **blocks** as shown below.

26. Now click on **Text** under **Built-in** and click on block.

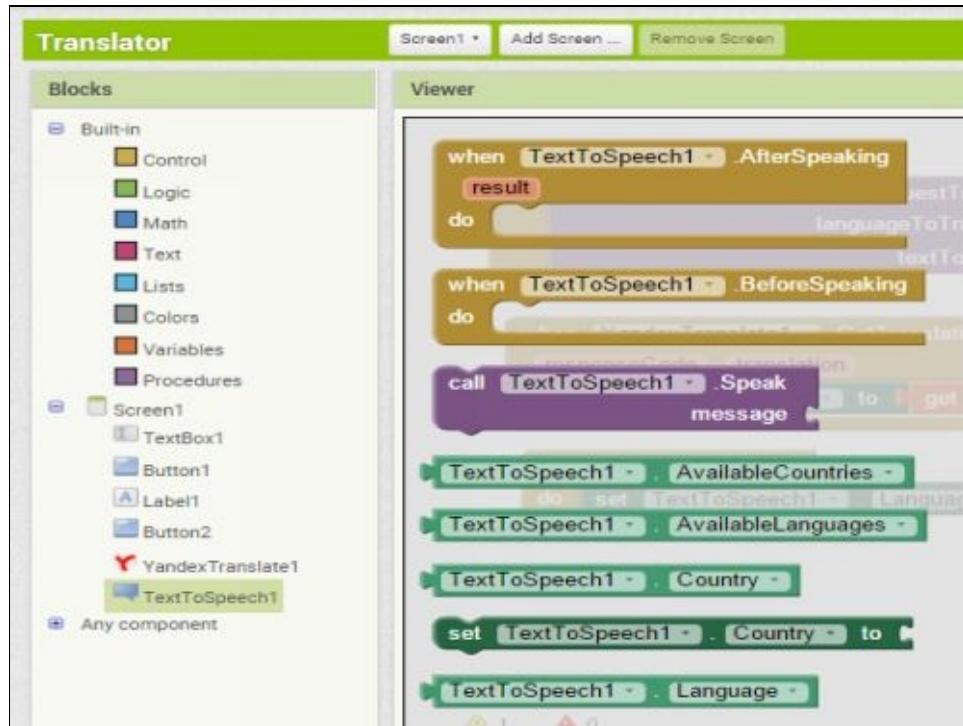

27. Type 'spa' as **text** and attach the **blocks** as shown below and attach the **blocks** as shown below. This will tell your app to speak in 'Spanish' language.

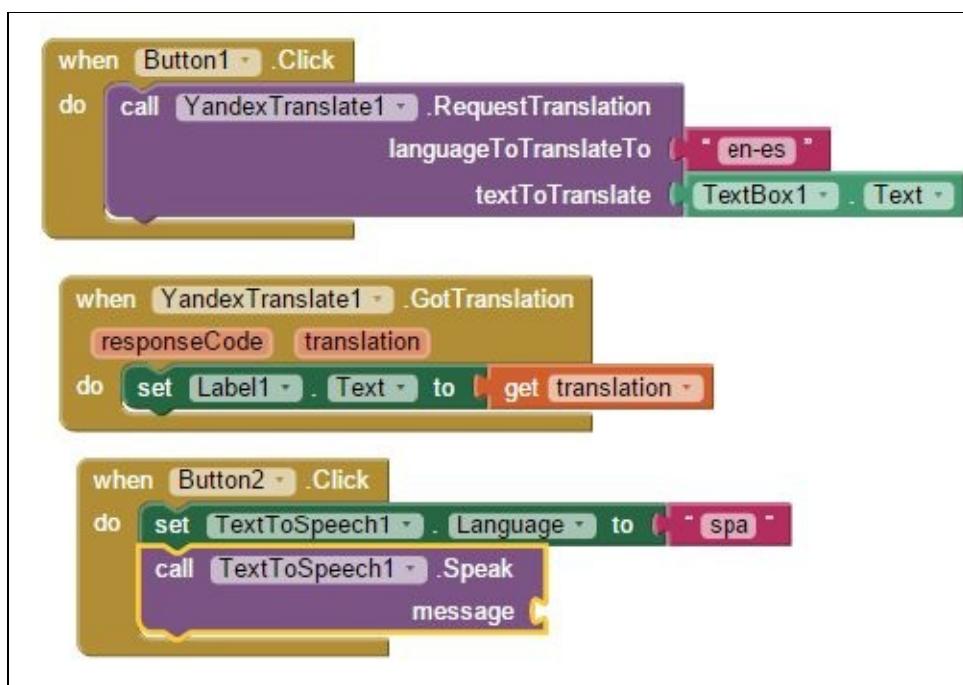

call [TextToSpeech1 v].Speak

message

28. Now click on **TextToSpeech1** and click on **block**. This block will speak some message given to it as input.

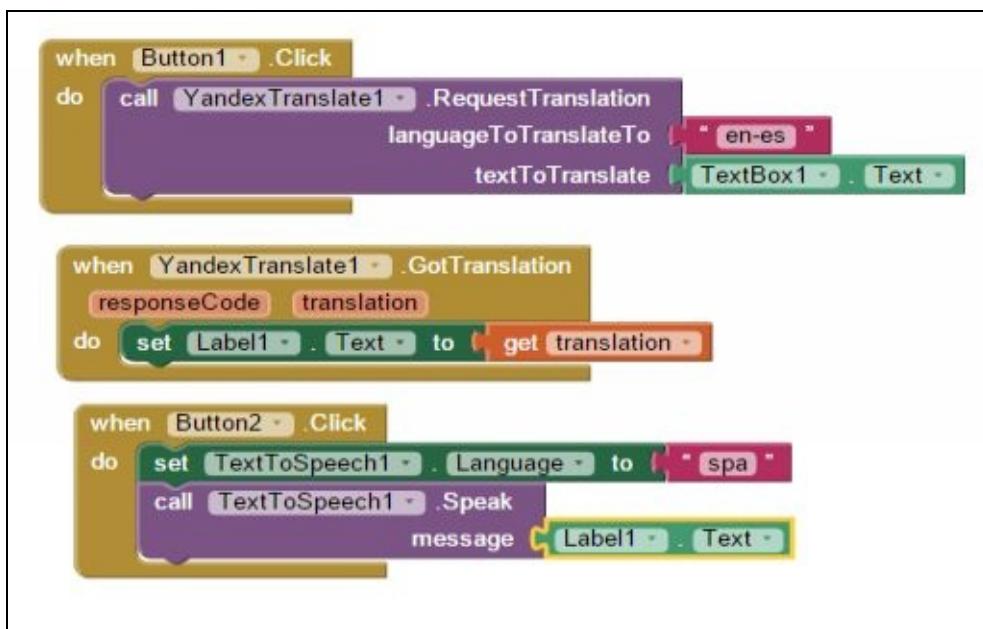

29. Attach the **blocks** as shown below.

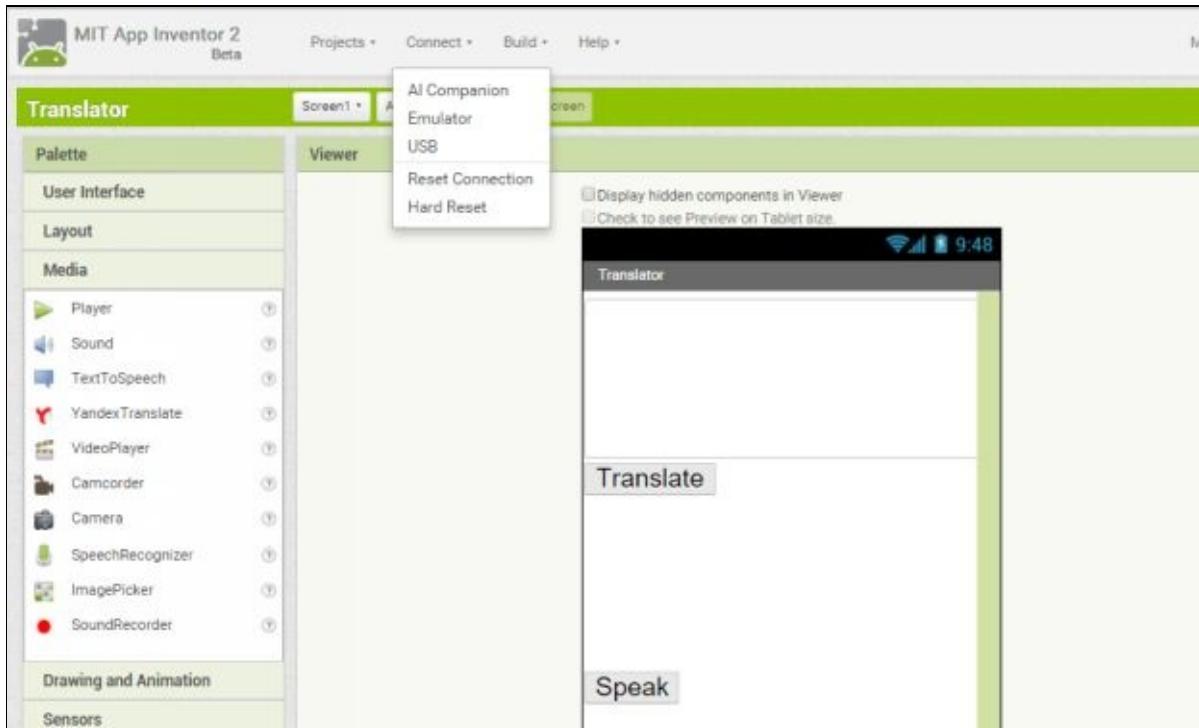

30. Click on **Label1** and select block.

31. Attach the **blocks** as shown below. So when you click Button2 your app will speak Label1's Text .

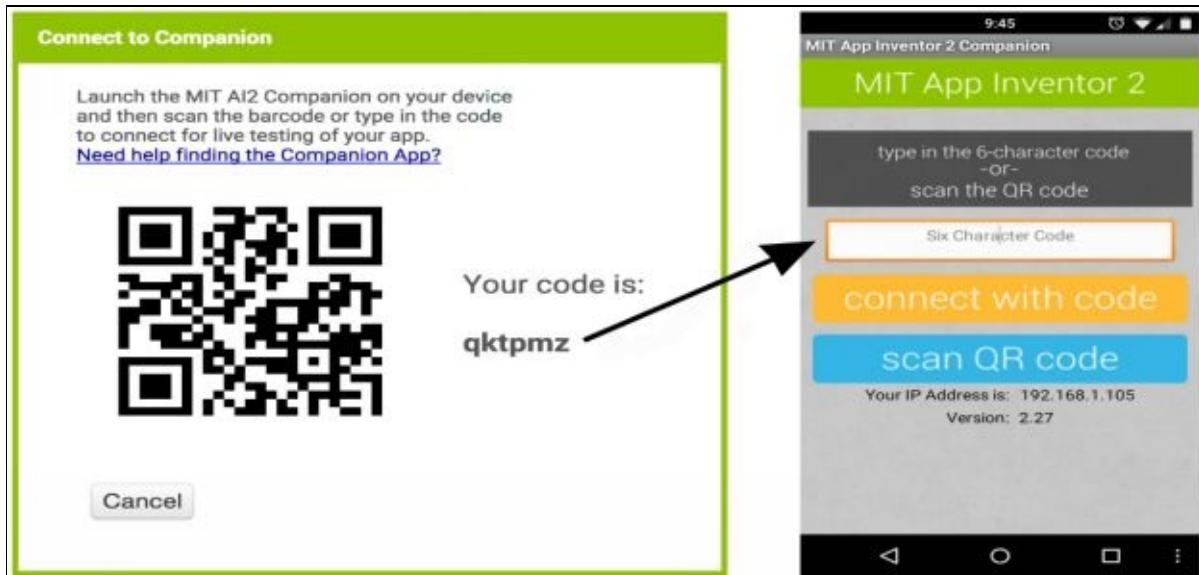

32. Now go to **Designer** and click on **Connect** and the **AI Companion**.

33. Now open MIT [App Inventor 2 Companion](#) in your mobile/Tablet.

And enter the code or scan the [QR code](#) from your mobile and click on connect with code.

Note:- Your Mobile/Tablet should be connected to same wi-fi/network to which your computer/Laptop is connected.

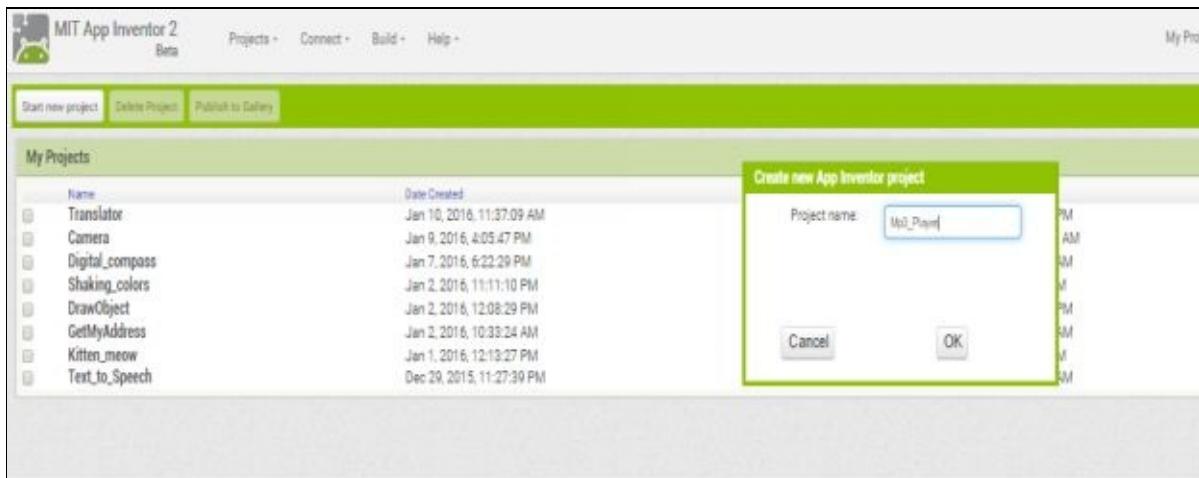

34. Now you should see your app in your phone for live testing. Type anything in the **textbox** and click on **Translate button** and the Spanish text will be shown below **Translate Button**. Now click on **Speak Button**, your phone will speak the text in Spanish.

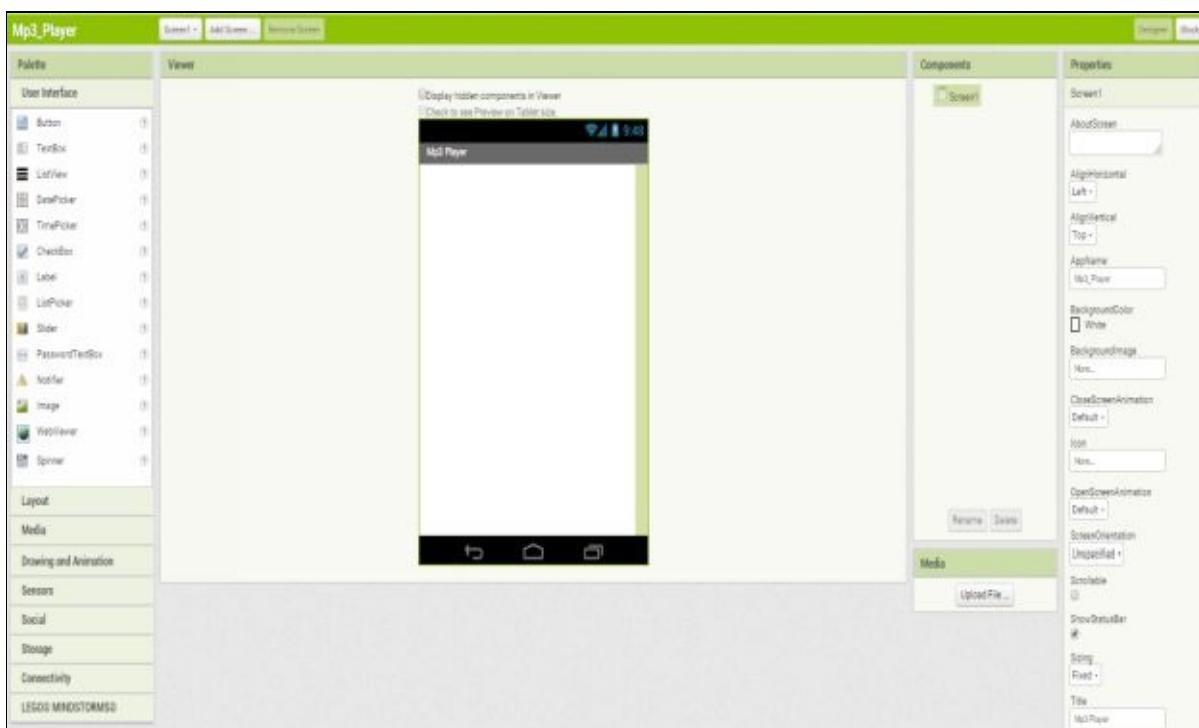

## Chapter 12: Mp3 Player App

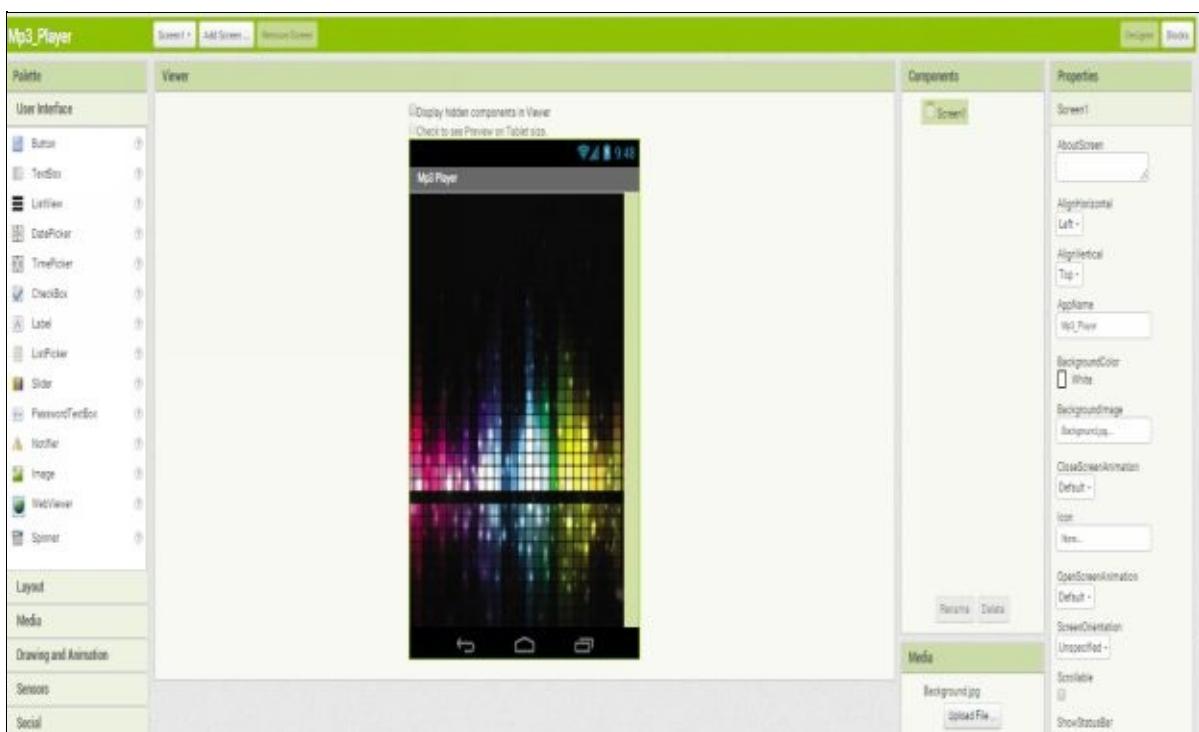

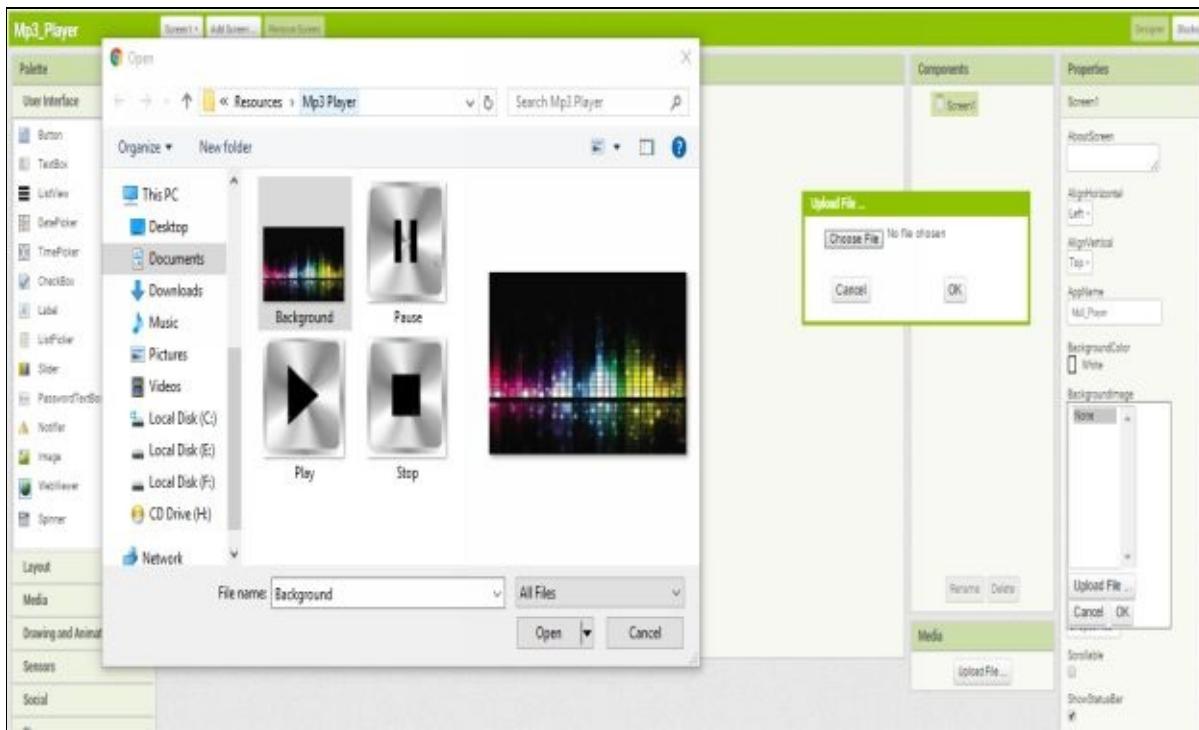

1. Click on **Start new project** and give it name **Mp3\_Player** and click **OK**.

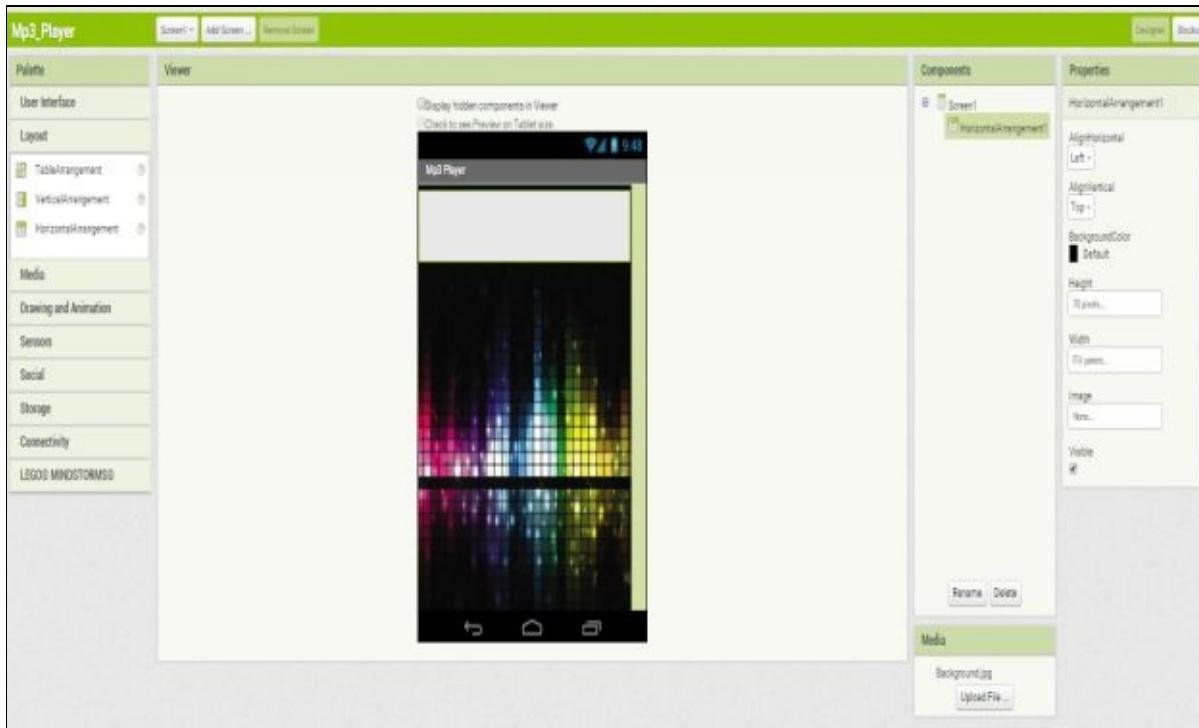

## 2. Change Screen1 Title to Mp3 Player.

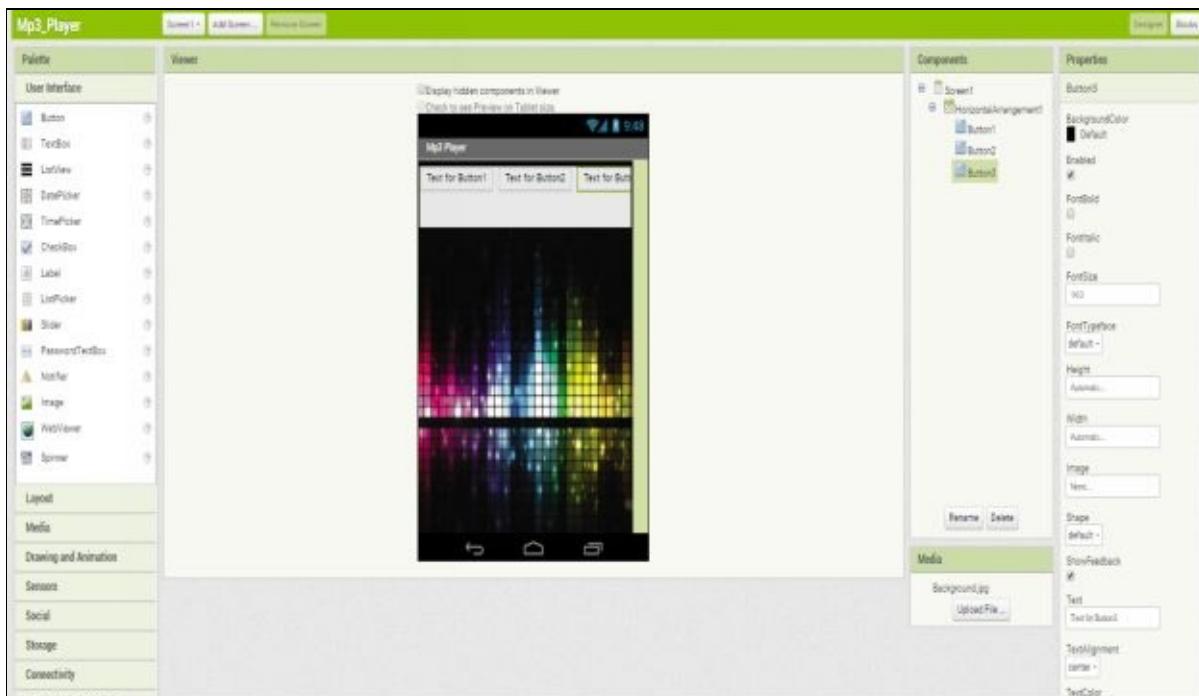

## 3. Change screen Background image to Background.jpg and click OK.

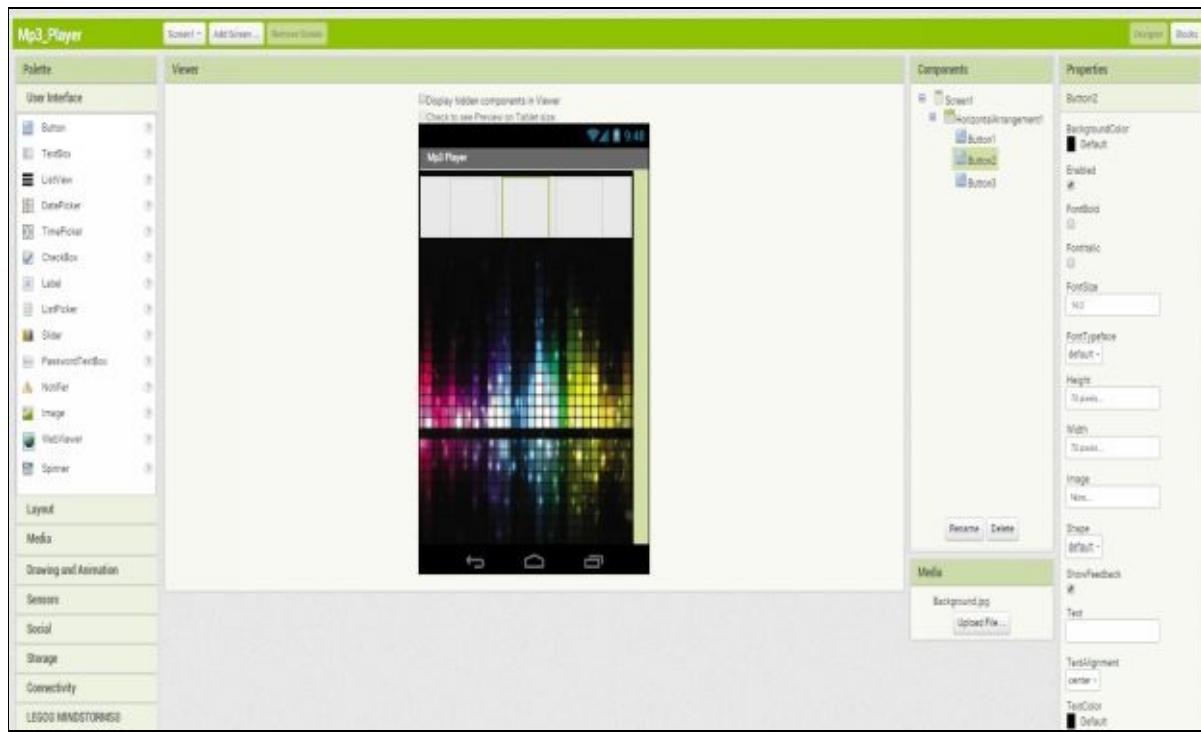

4. Now drag a **HorizontalArrangement** component from **Palette** to **Viewer** screen and set its **Height** to **70** pixels and **Width** to **Fill Parent**.

5. Now drag 3 Buttons from **Palette** to **Viewer** screen inside **HorizontalArrangement1** component.

6. Set All **Button's text to blank** and set **Height** and **Width** both to **70 pixels** for all the 3 **Buttons**.

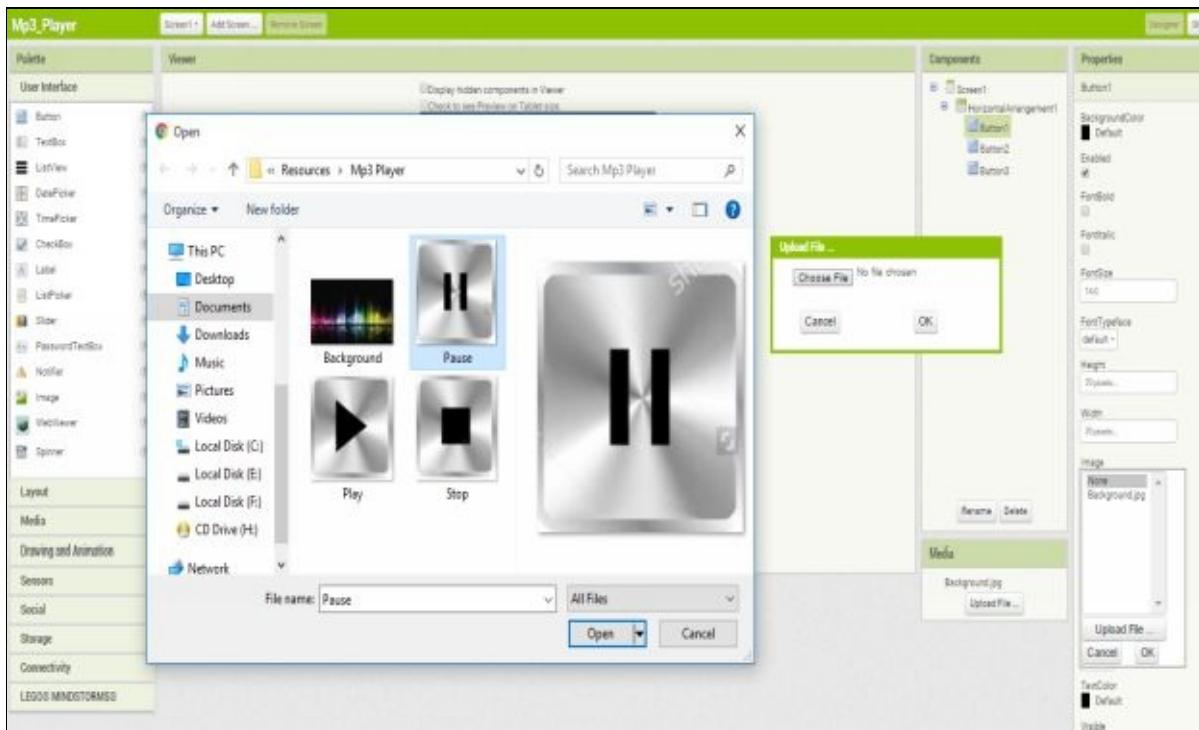

7. Now Upload the **Button's images** as given below:-

**Button1-Pause button.**

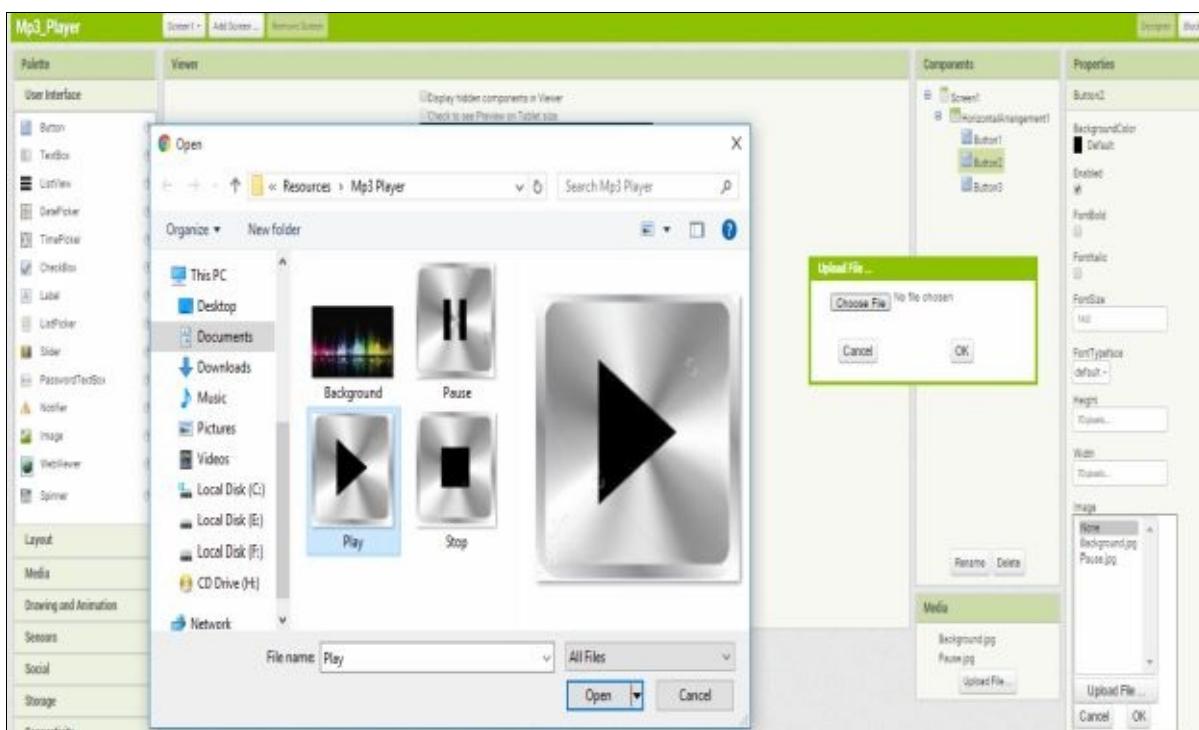

**Button2-Play button**

**Button3-Stop button**

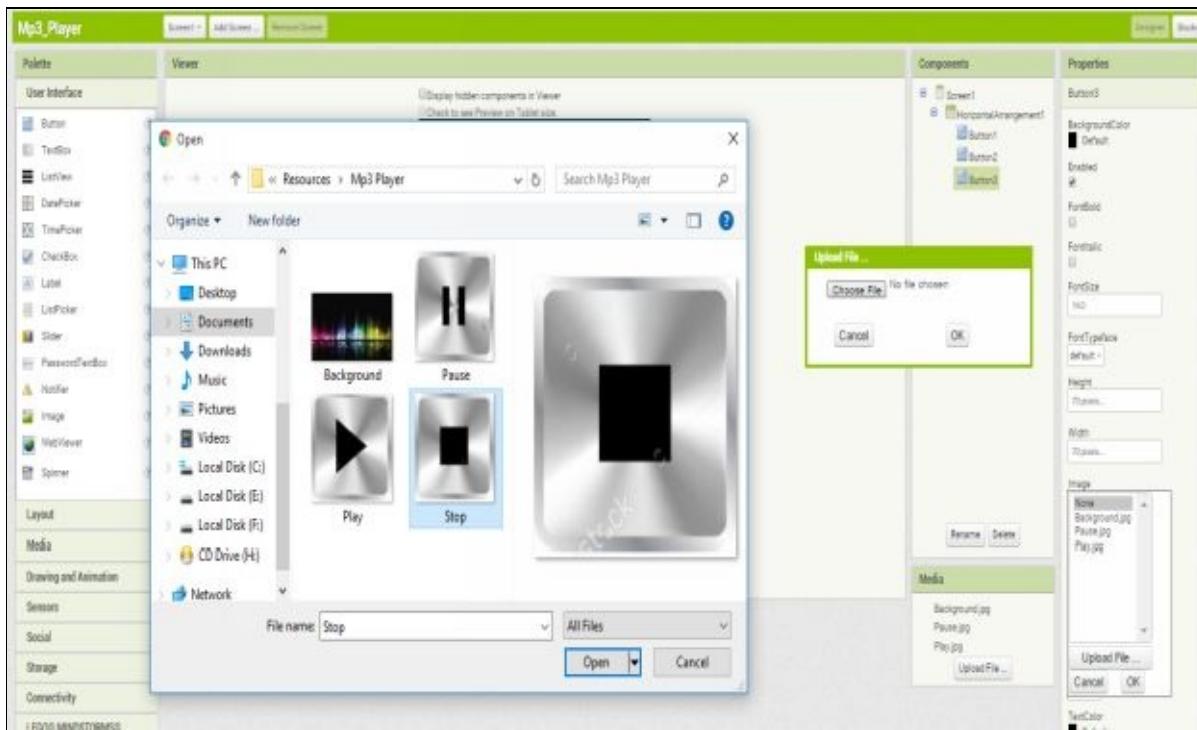

**Button1:**

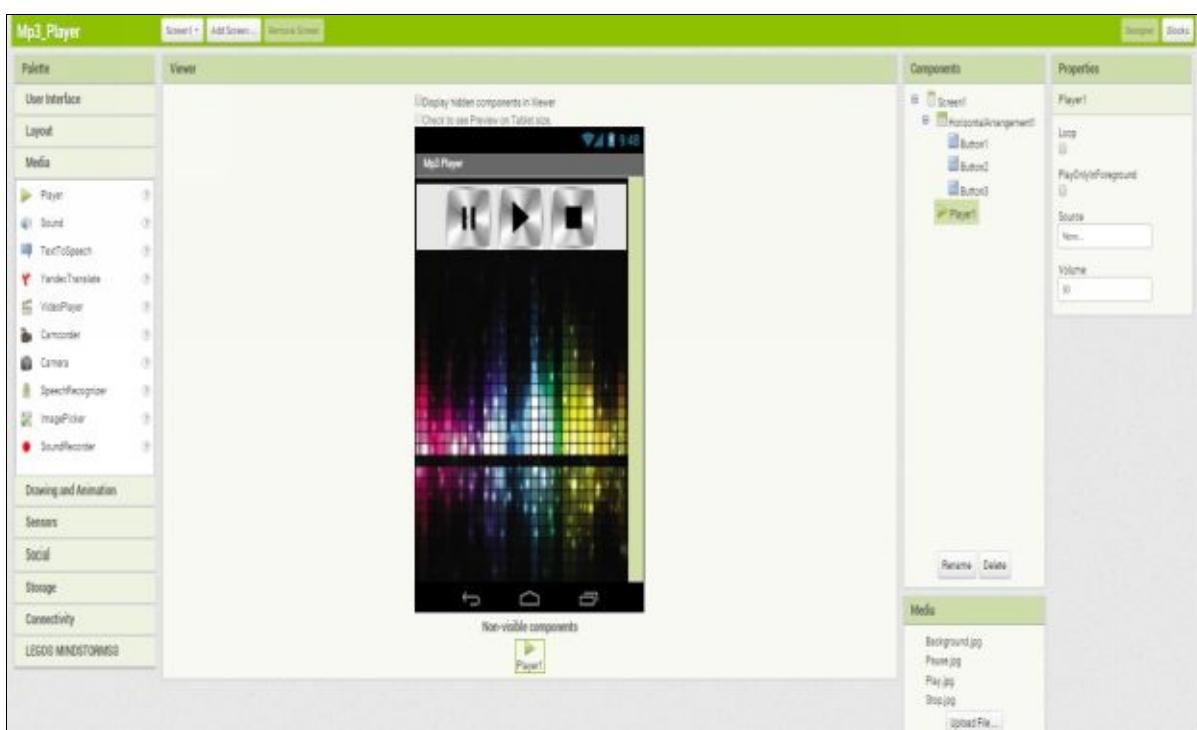

Button2:

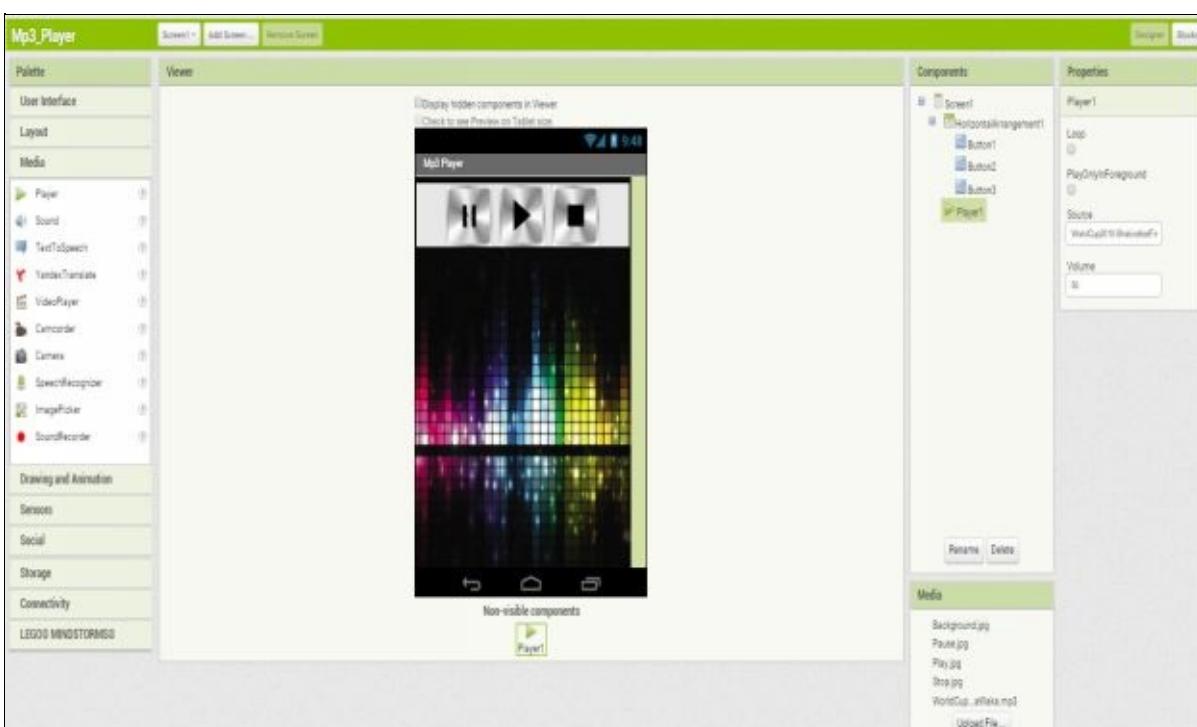

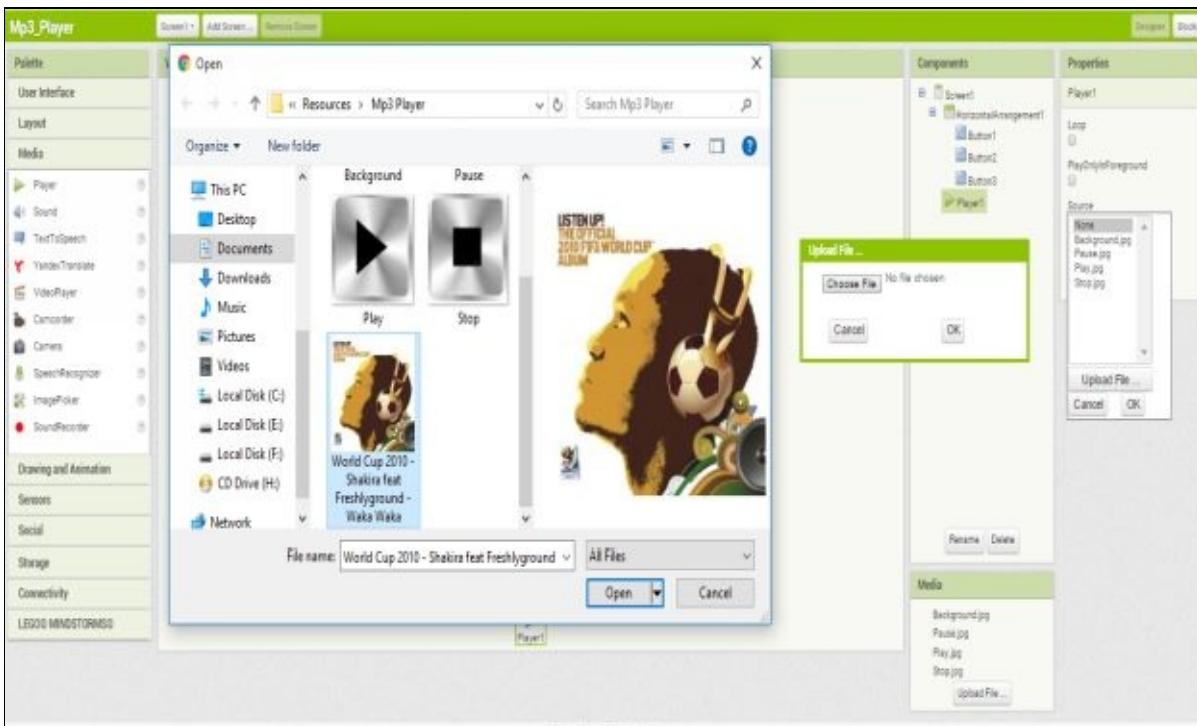

Button3:

## 8. Now Drag a Player (non-visible) component from Palette to Viewer.

## 9. Change Player1 source to Mp3 file.

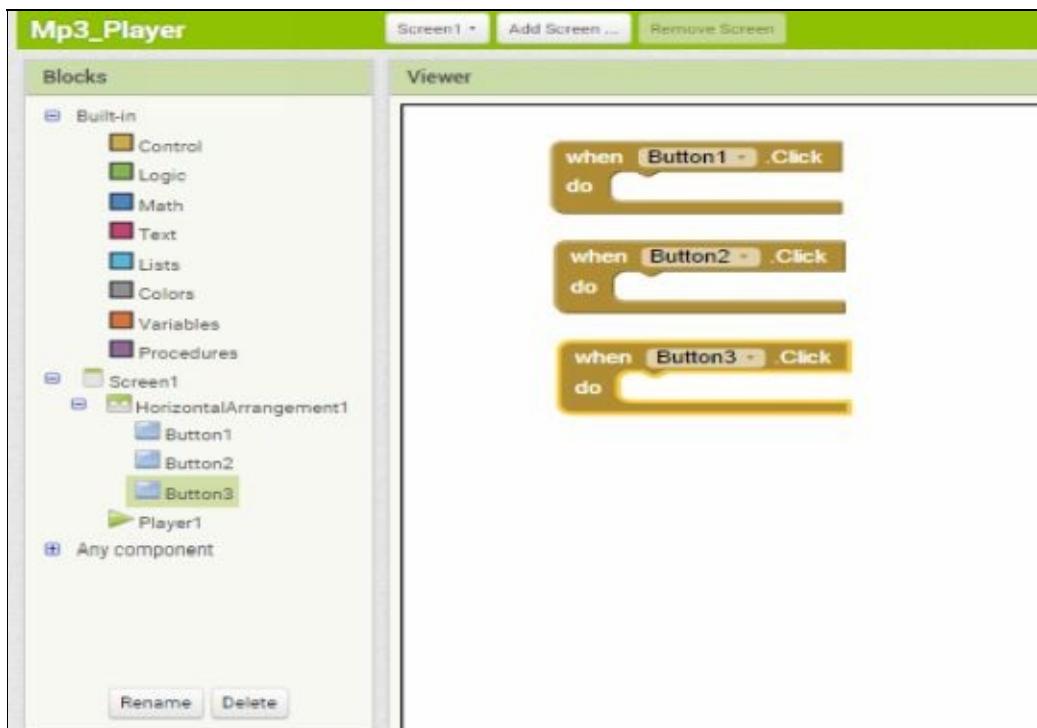

10. Now go to **Blocks** and select these 3 **blocks** shown below.

```

when Button1.Click
do [ ](1)

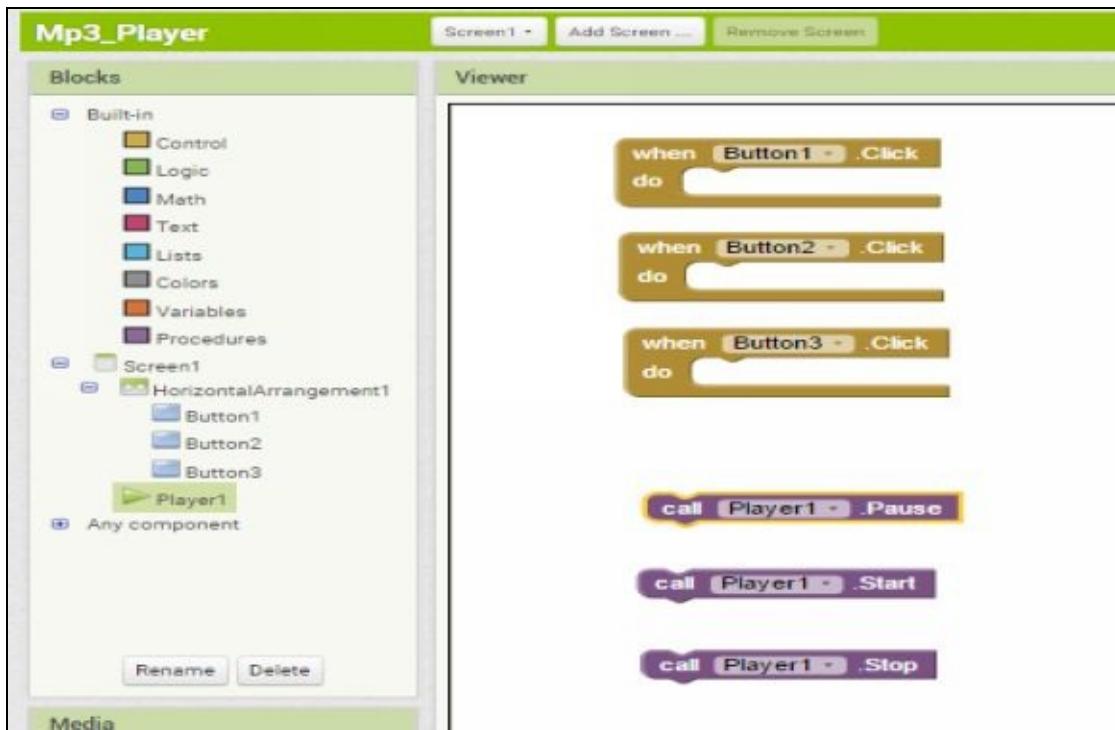

when Button2.Click
do [ ](2)

when Button3.Click
do [ ](3)
  
```

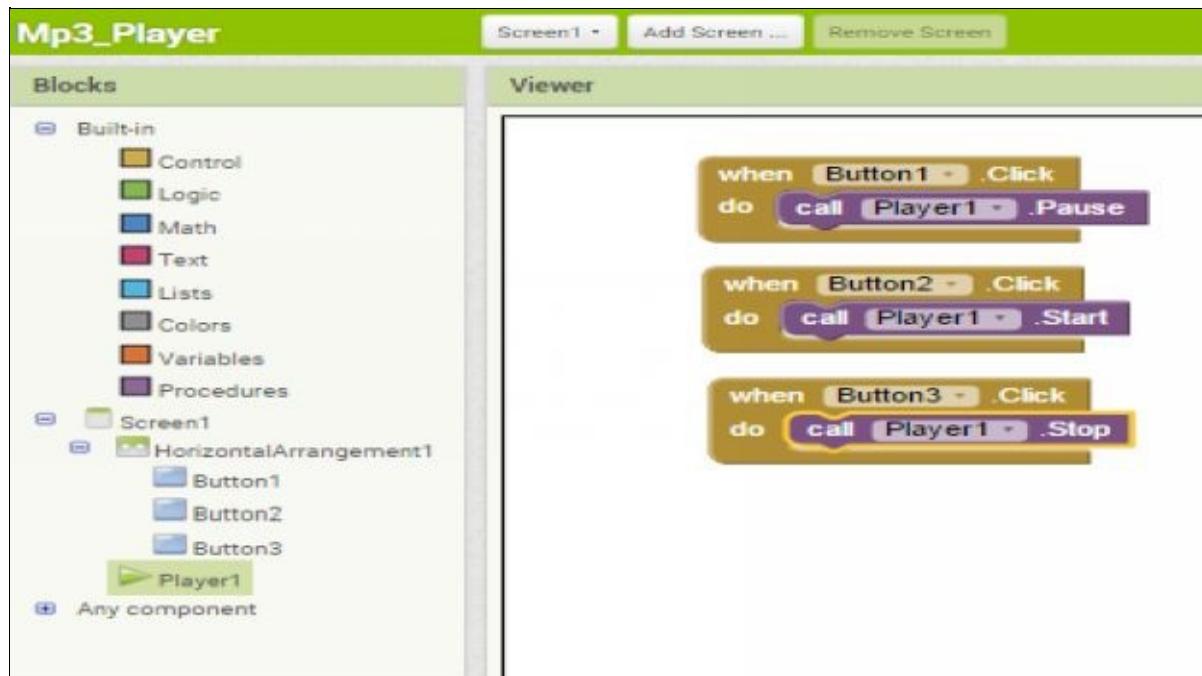

11. Click on **Player1** and select **blocks**.

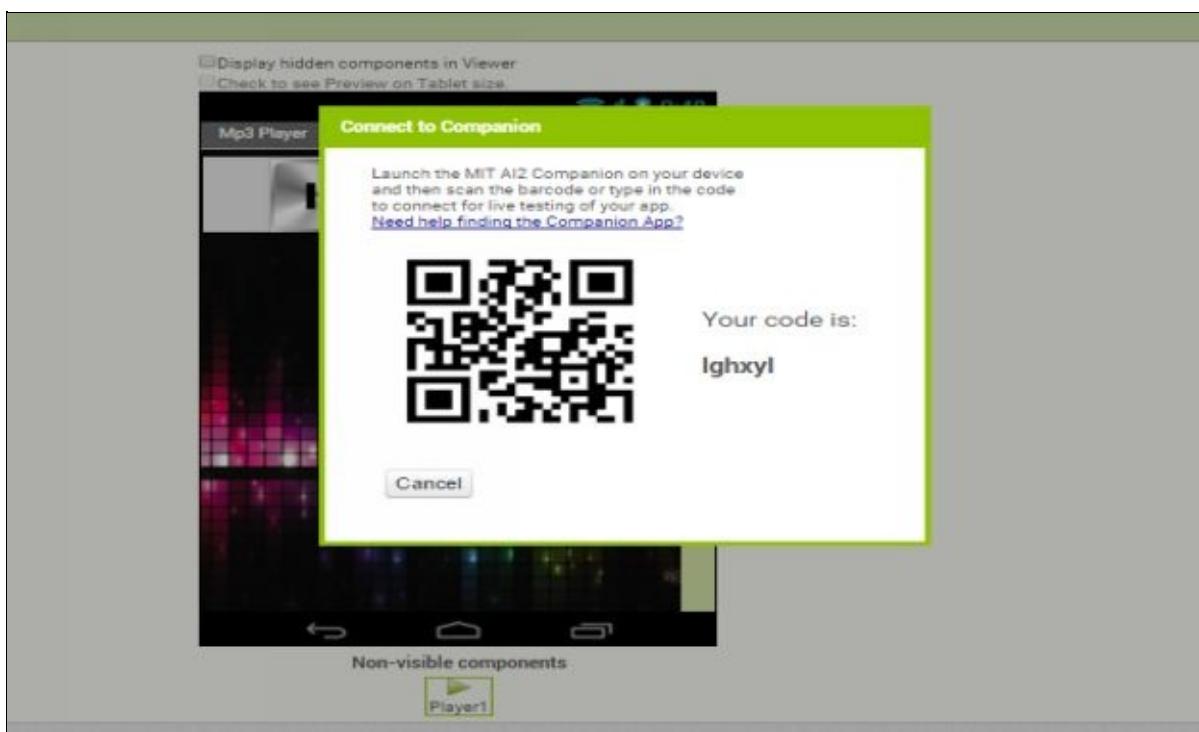

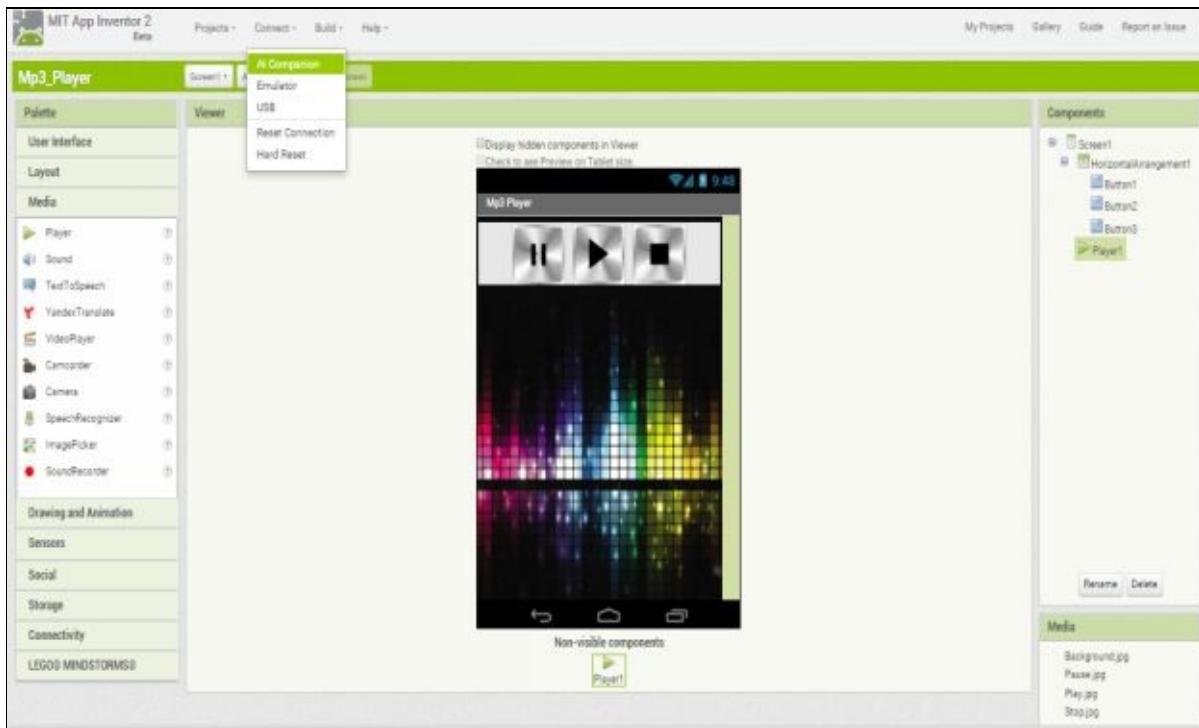

12. Attach the **blocks** as shown below. So when you click Button1 your Player will pause and when you click Button2 your Player will start and when you click Button1 your Player will stop.

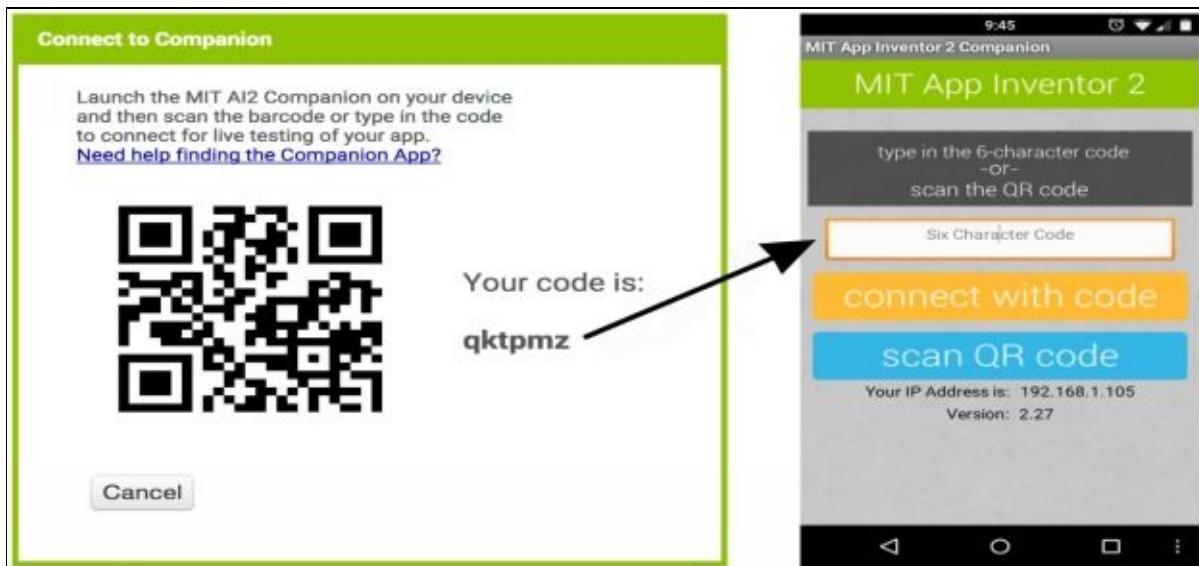

13. Now go to **Designer** and click on **Connect** and then click on **AI Companion**.

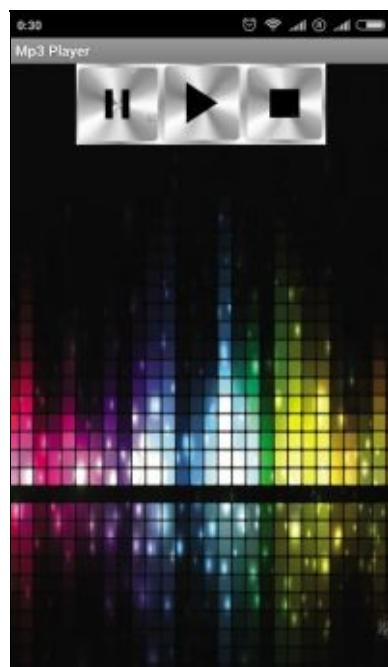

14. Now open MIT [App Inventor 2 Companion](#) in your mobile/Tablet.

And enter the code or scan the [QR code](#) from your mobile and click on connect with code.

Note:-Your Mobile/Tablet should be connected to same wi-fi/network to which your computer/Laptop is connected.

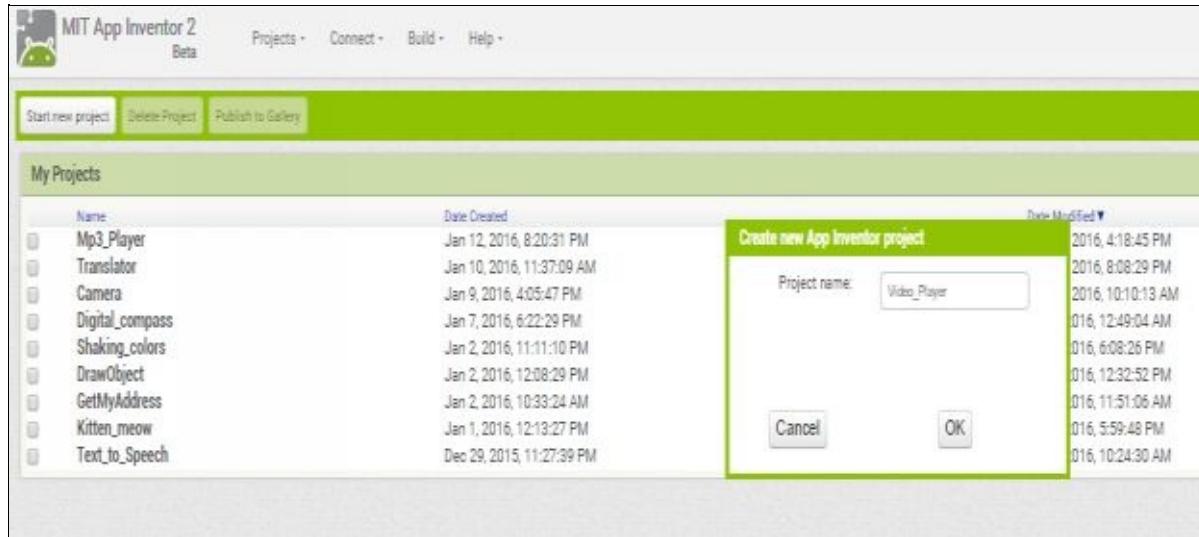

15. Now you should see your app in your phone for live testing. [Click on play Button to test your Mp3\\_Player App.](#)

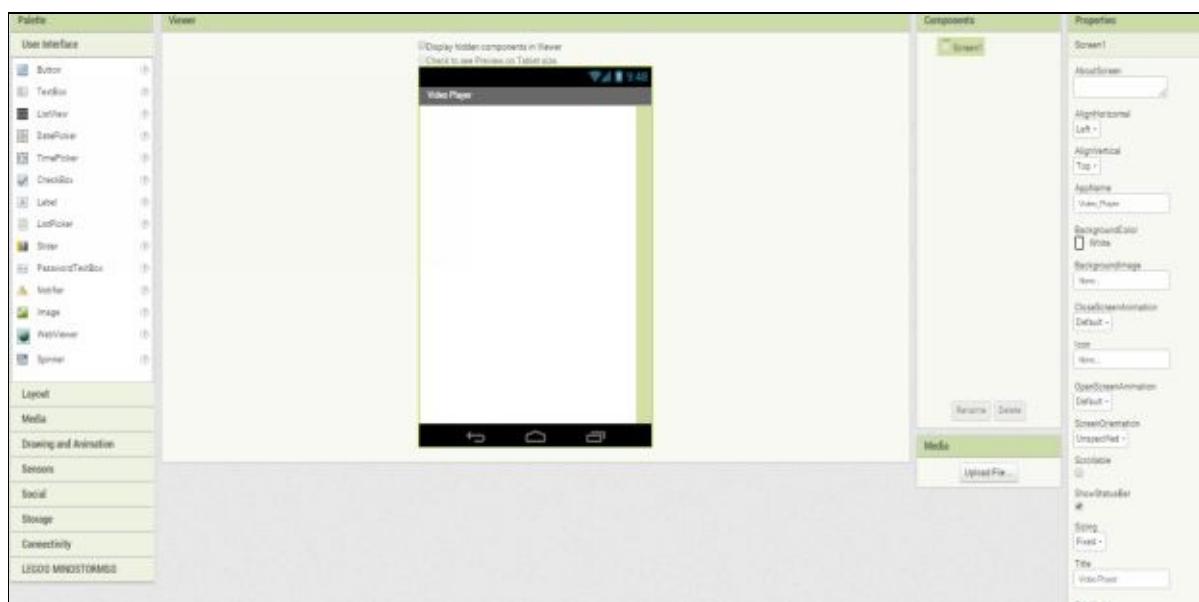

# Chapter 13: Video Player App

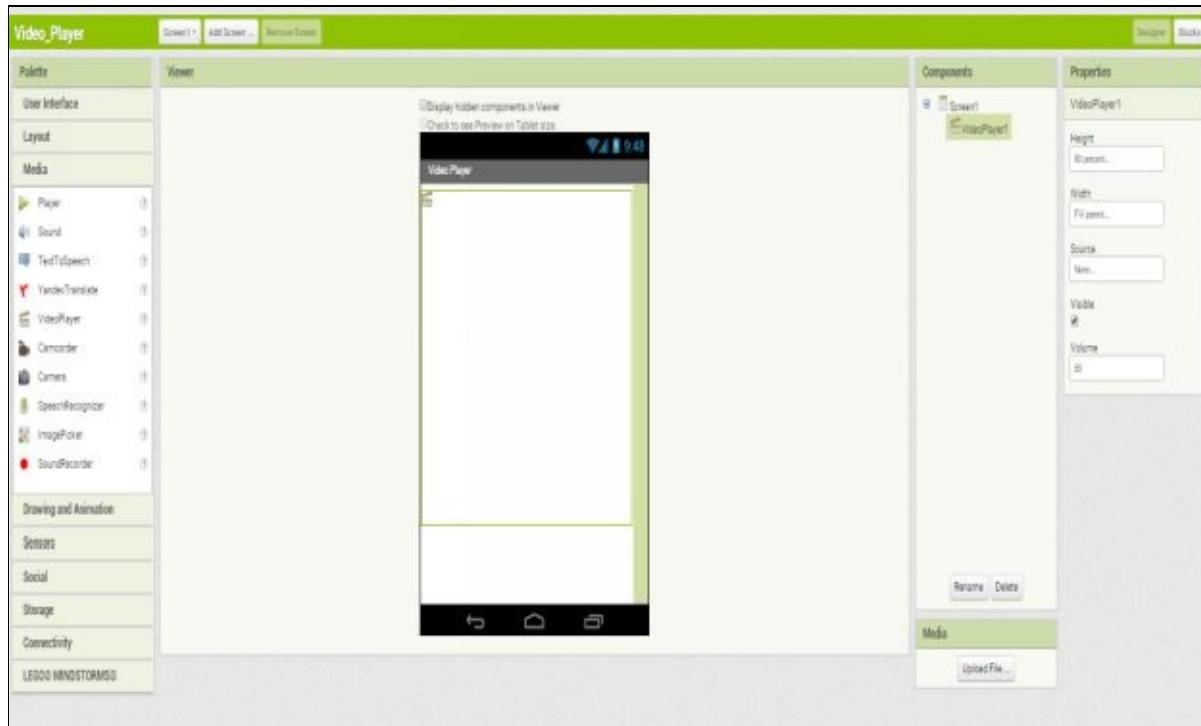

1. Click on **Start new project** and give it name **Video\_Player** and click **OK**.

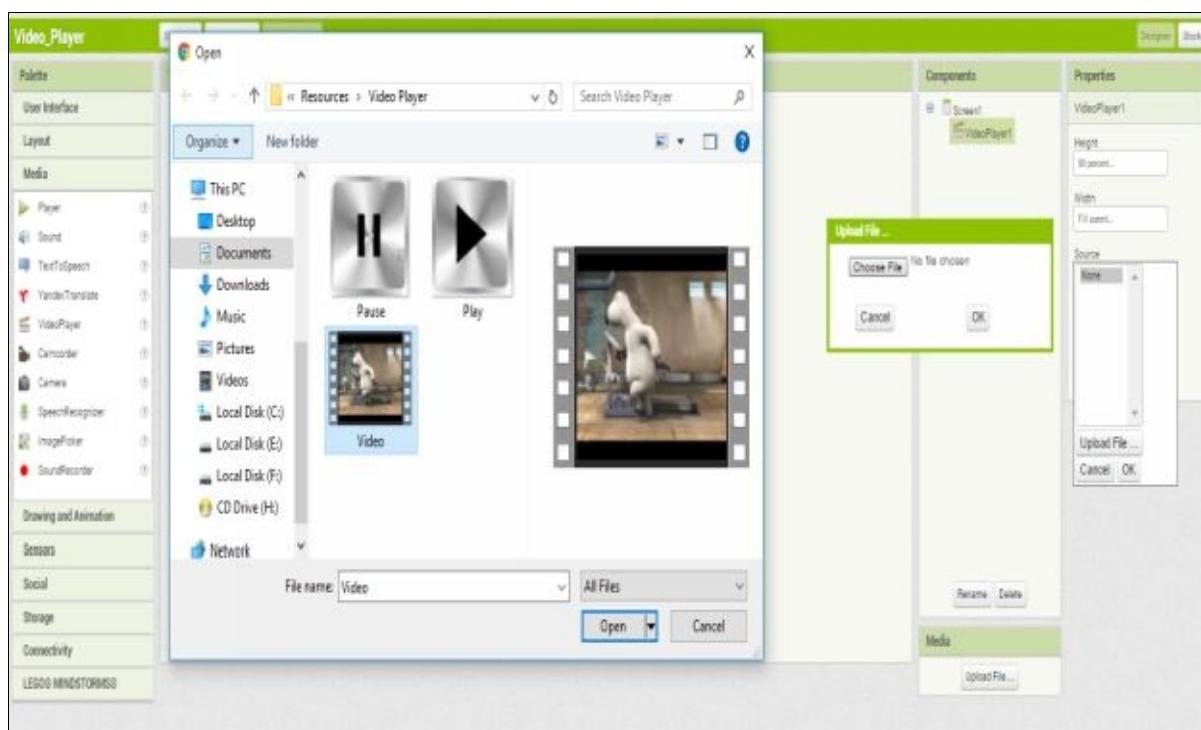

2. Now change **Screen1 Title** to **Video Player**.

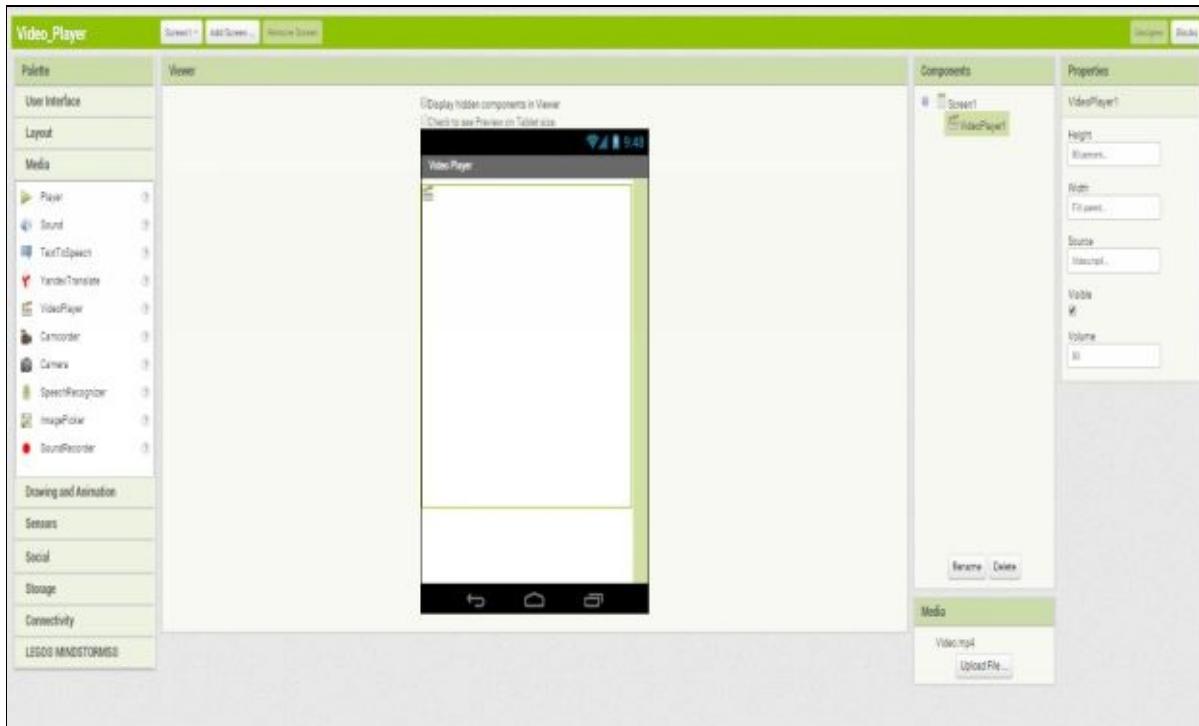

3. Drag **VideoPlayer** component from **Palette** to **Viewer** and set its **Height** to **80 percent** and **Width** to **Fill Parent**.

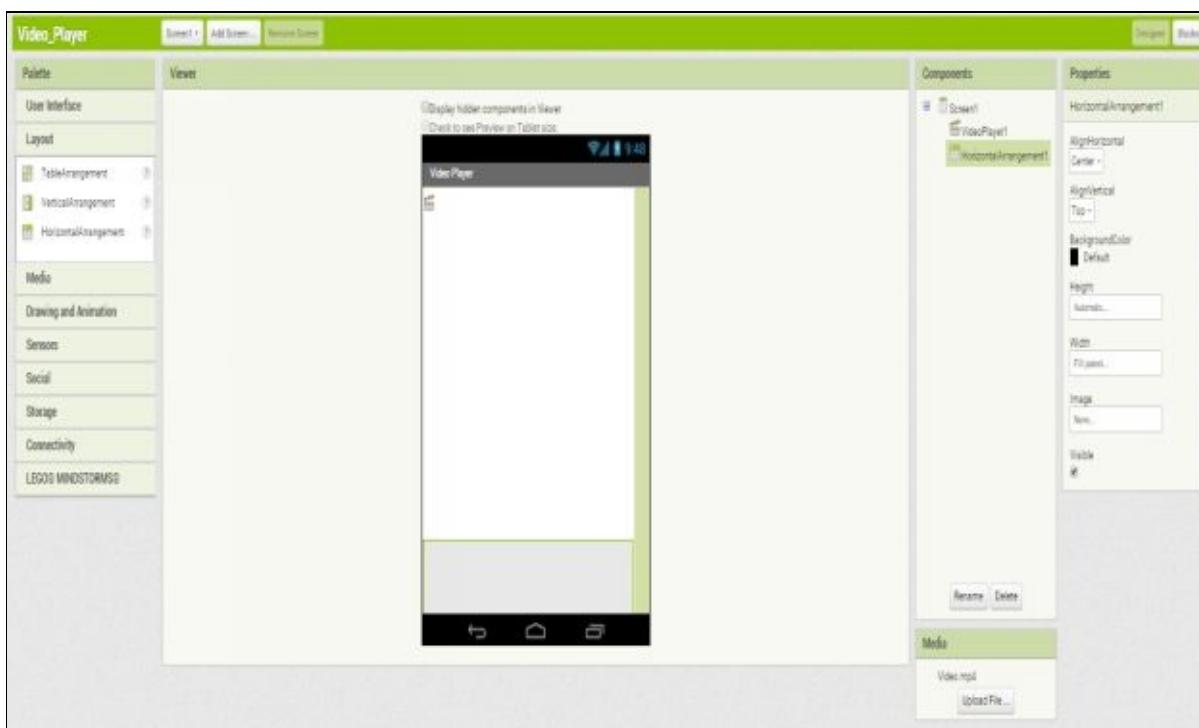

#### 4. Change VideoPlayer1's Source to Video.mp4.

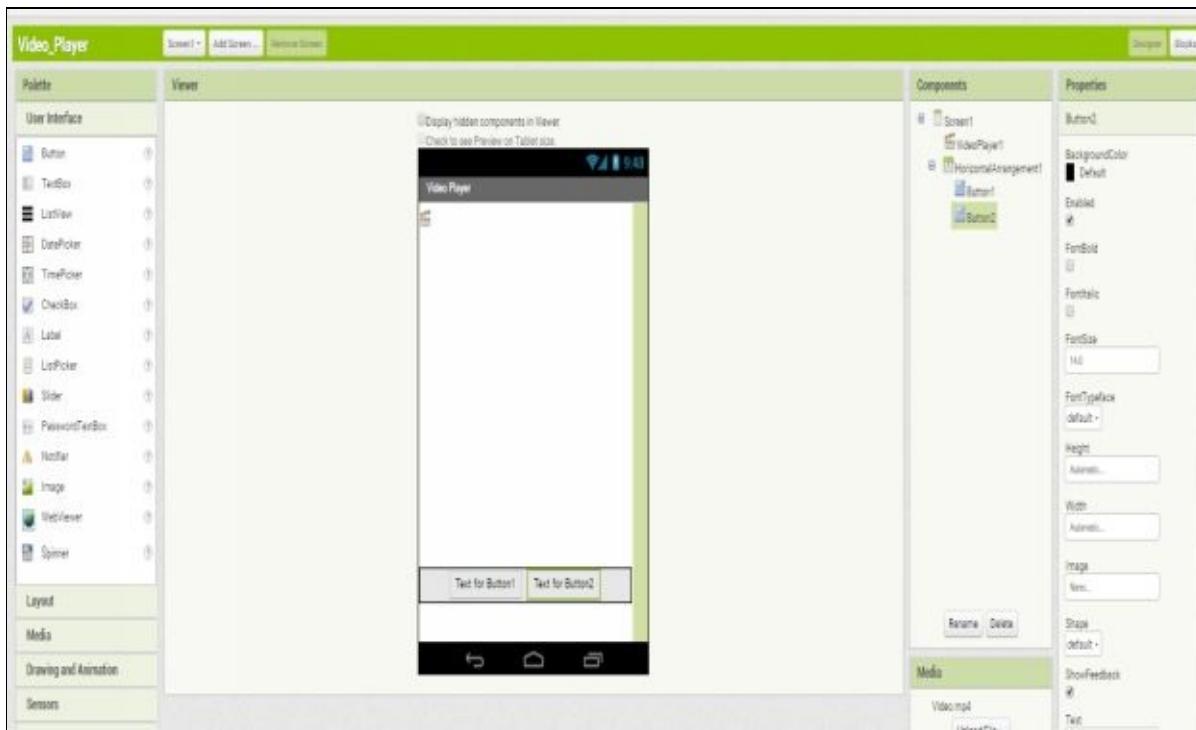

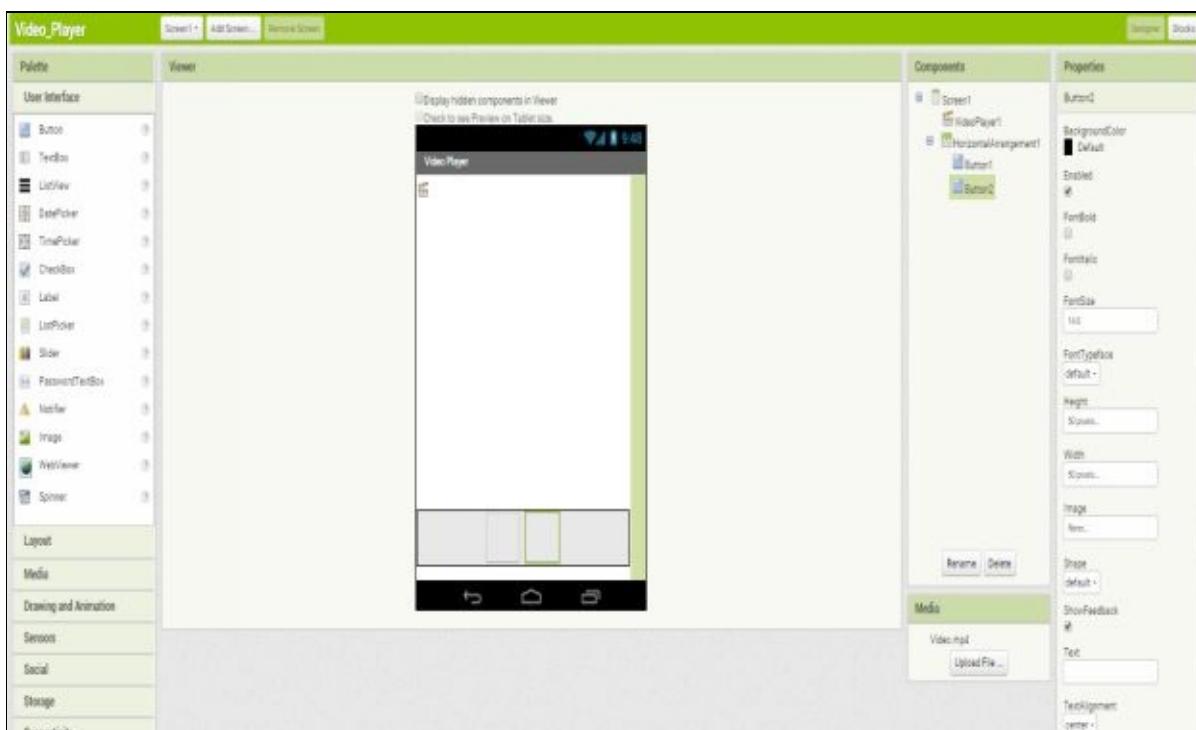

5. Drag a **HorizontalArrangement** component from **Palette** to **Viewer** and set its **Width** to **Fill Parent** and **AlignHorizontal** Property to **Center**.

6. Now drag two **Buttons** from **Palette** to **Viewer** inside **HorizontalArrangement1**.

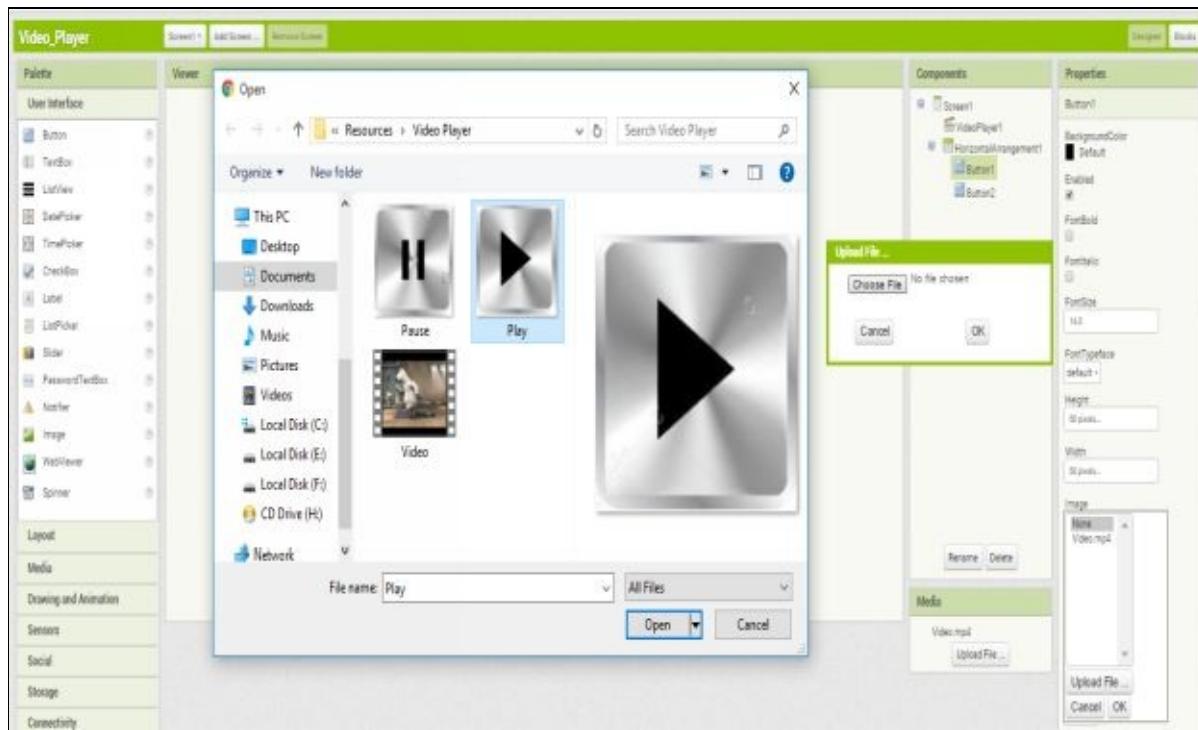

7. Change both Button's Width and Height to 50 pixels and Delete the Texts for both the buttons.

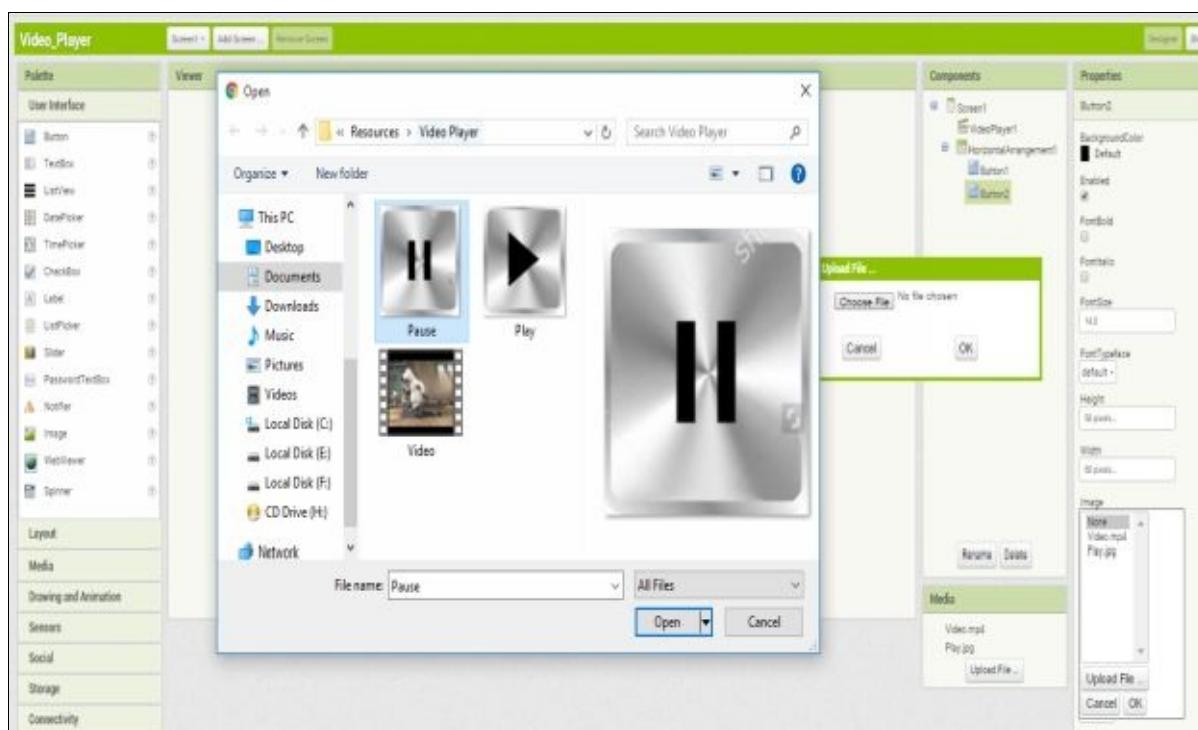

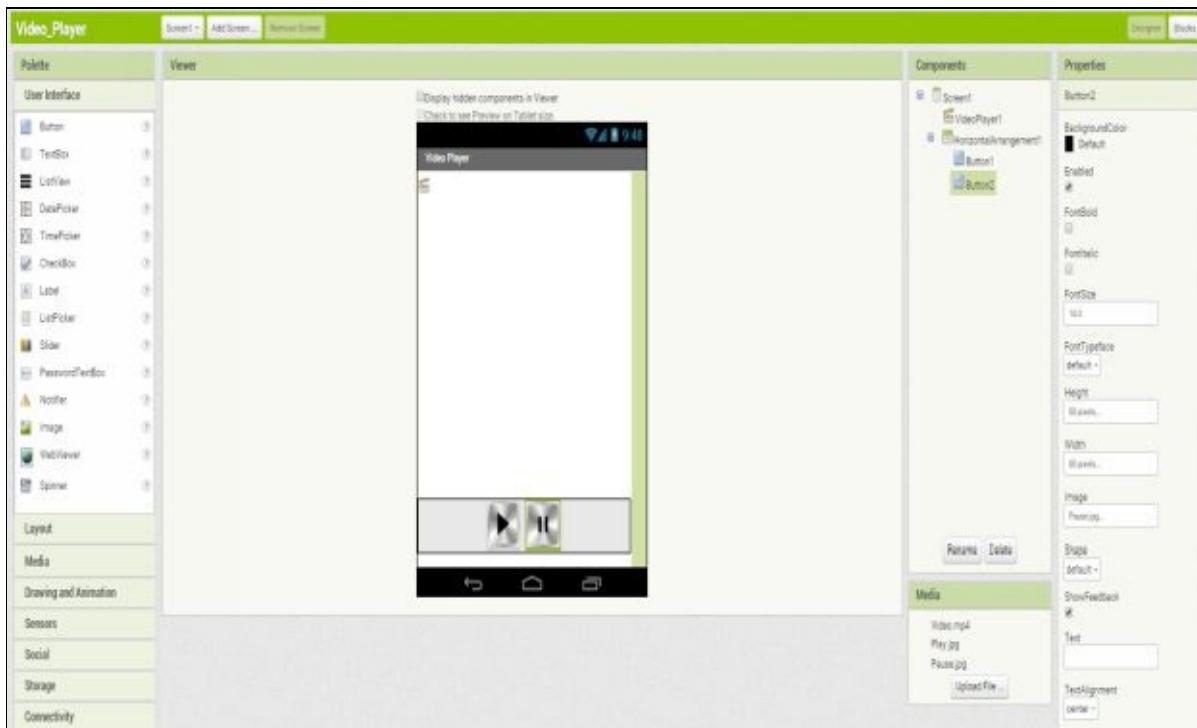

8. Change Button's Image as shown below.

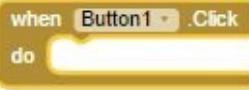

**Button1:**

Button2:

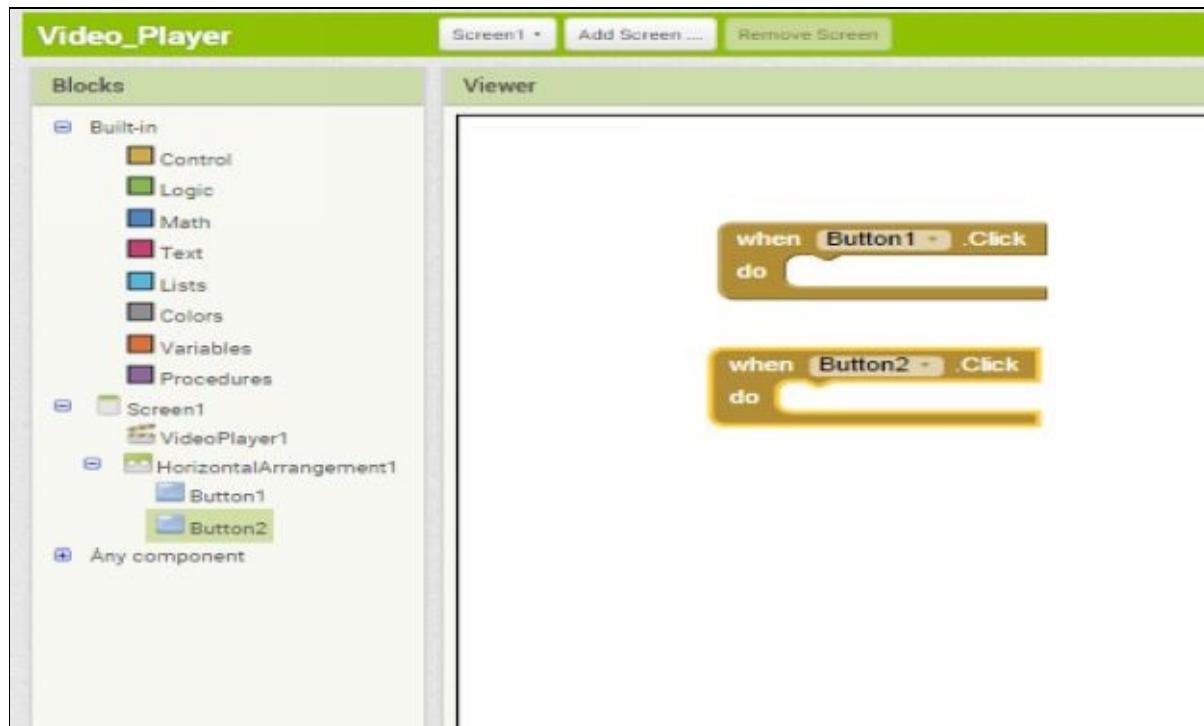

9. Go to Blocks and click on **Button1** component and select  block

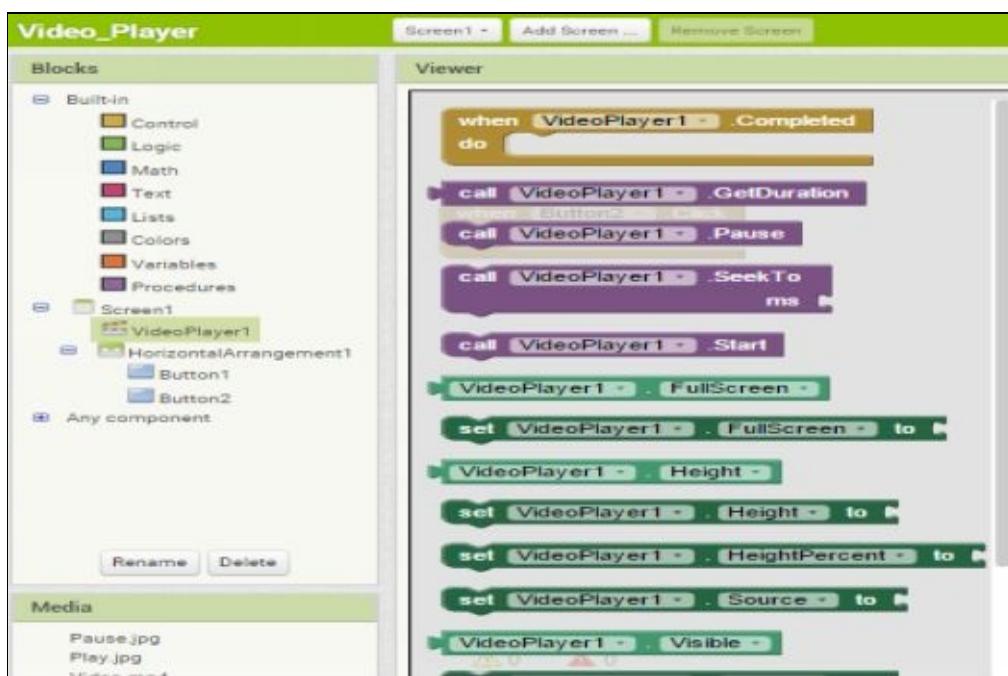

10. Click on **Button2** component and select  block.

call [VideoPlayer1 v].Pause

call [VideoPlayer1 v].Start

11. Now click on [VideoPlayer1](#) component and select blocks.

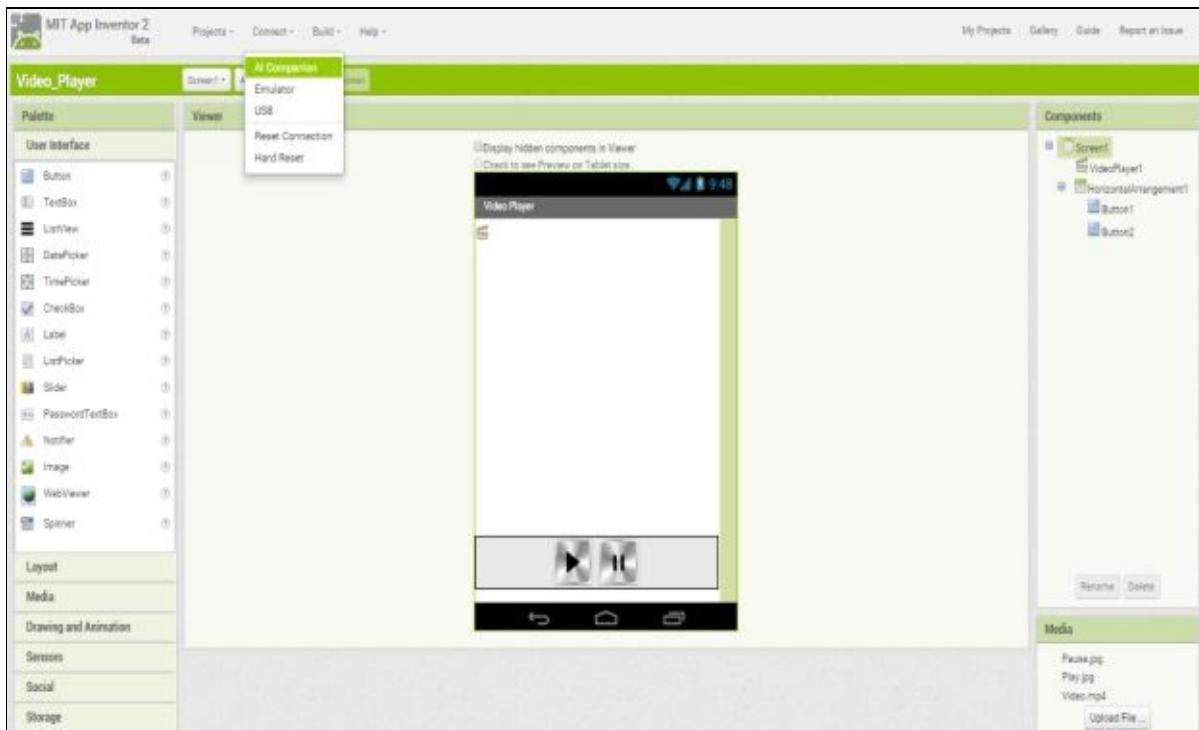

12. Now attach the **blocks** as shown below. So when you click Button1 your VideoPlayer will Start and when you click Button2 your VideoPlayer will Pause.

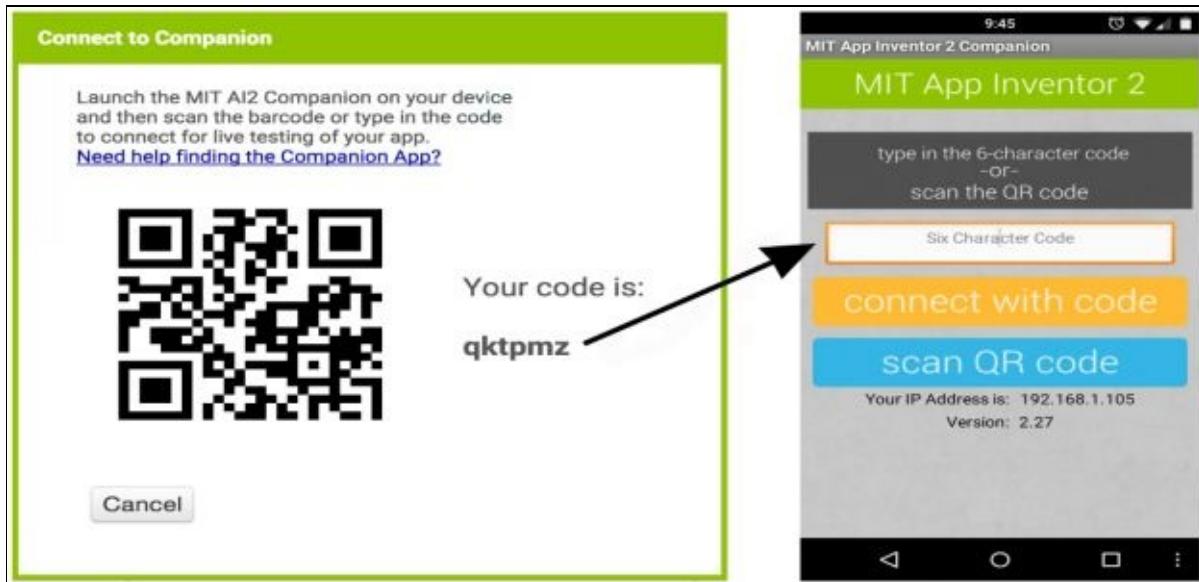

13. Now go to **Designer** and click on **Connect** then click on **AI Companion**.

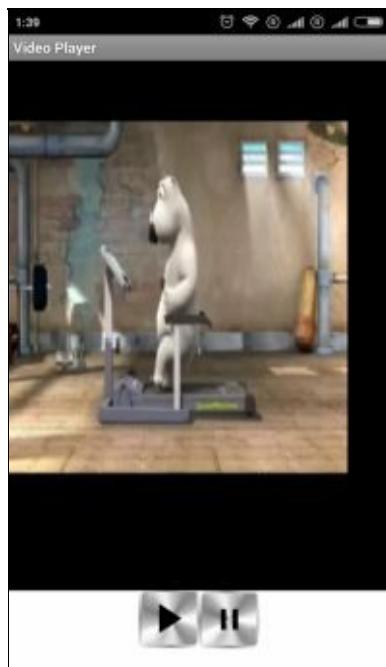

14. Now open [MIT App Inventor 2 Companion](#) in your mobile/Tablet.

And enter the code or scan the [QR code](#) from your mobile and click on connect with code.

Note:-Your Mobile/Tablet should be connected to same wi-fi/network to which your computer/Laptop is connected.

15. Now you should see your app in your phone for live testing. Click on Play Button to test your Video\_Player App.

## Chapter 14: Speech Recognizer App

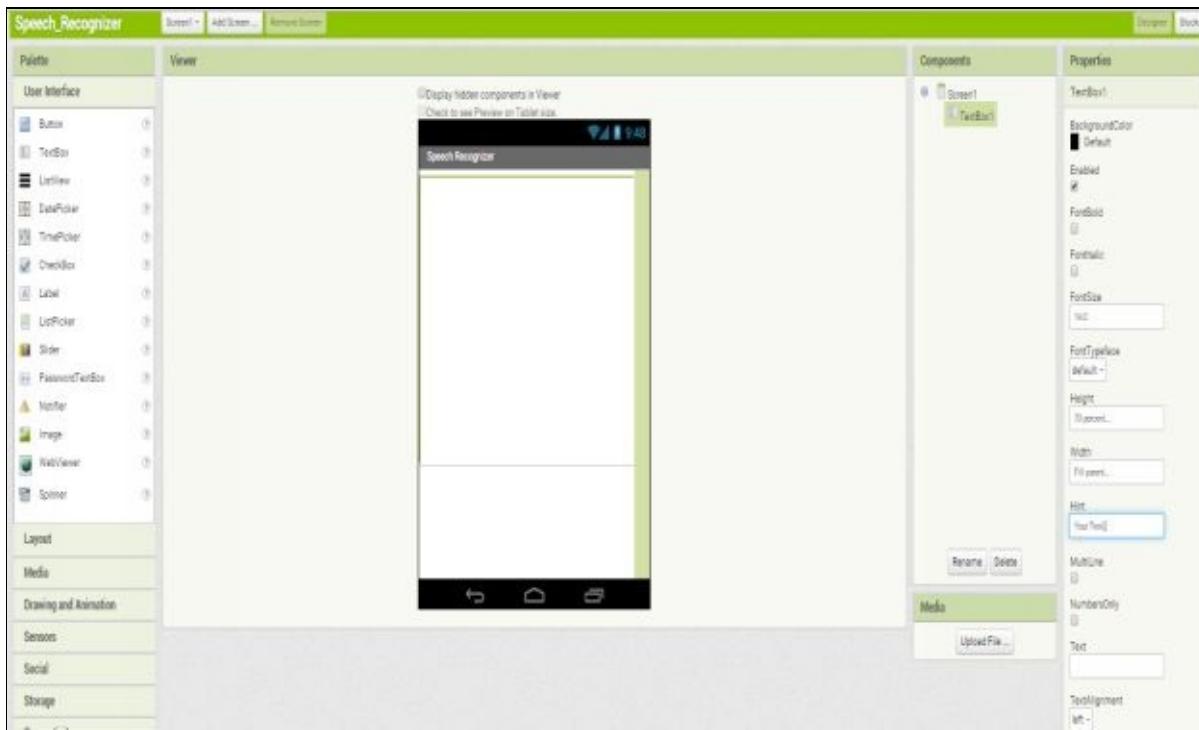

1. Click on **Start new project** and give it name **Speech\_Recognizer** and Click **OK**.

The screenshot shows the App Inventor web-based development environment. At the top, there are tabs for 'Start new project', 'Open Project', and 'Project Gallery'. Below that is a section titled 'My Projects' with a table listing various projects. A modal dialog box titled 'Create new App Inventor project' is open in the center. It contains a 'Project name' field with the value 'Speech\_Recognizer' and two buttons at the bottom: 'Cancel' and 'OK'. The main workspace area is visible in the background.

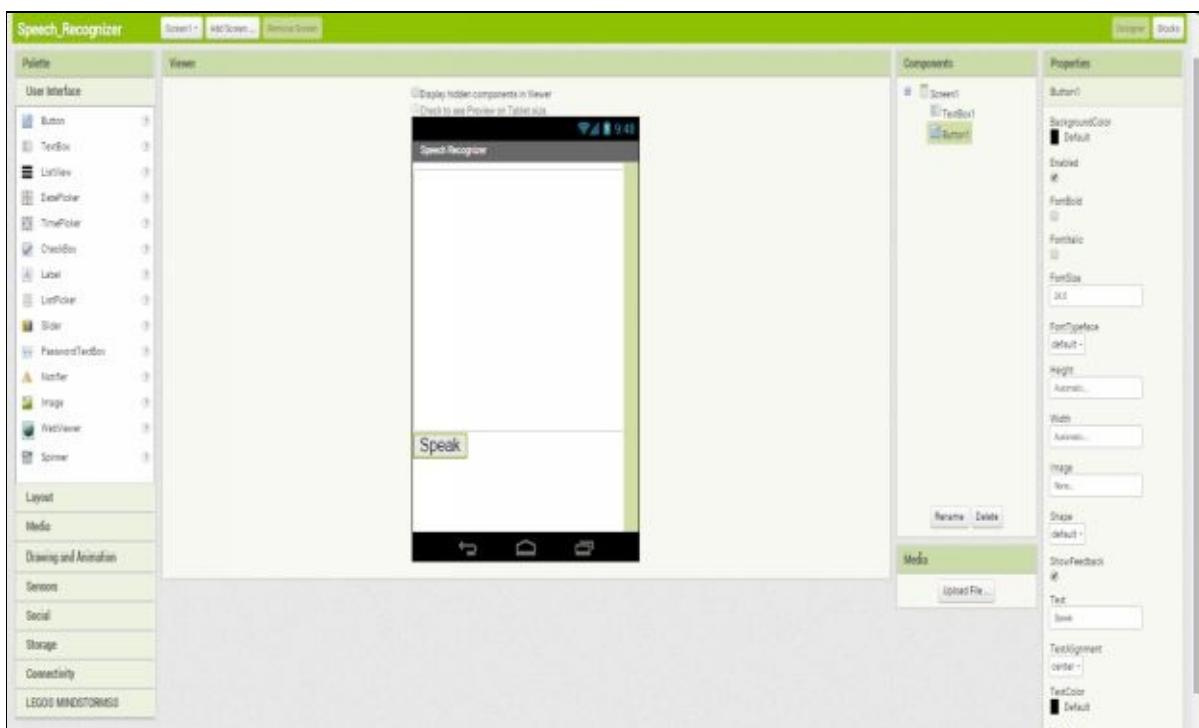

## 2. Now change Screen1 Title to Speech Recognizer.

This screenshot shows the 'Speech\_Recognizer' project in the Designer view. The left sidebar has a 'Palette' section with categories like User Interface, Layout, Media, etc. The central 'Viewer' area shows a mobile phone screen with the title 'Speech Recognizer'. To the right is the 'Components' pane, which lists a single 'Screen' component with the ID 'Screen1'. The 'Properties' pane on the far right shows settings for 'Screen1', including 'Title' set to 'Speech Recognizer'.

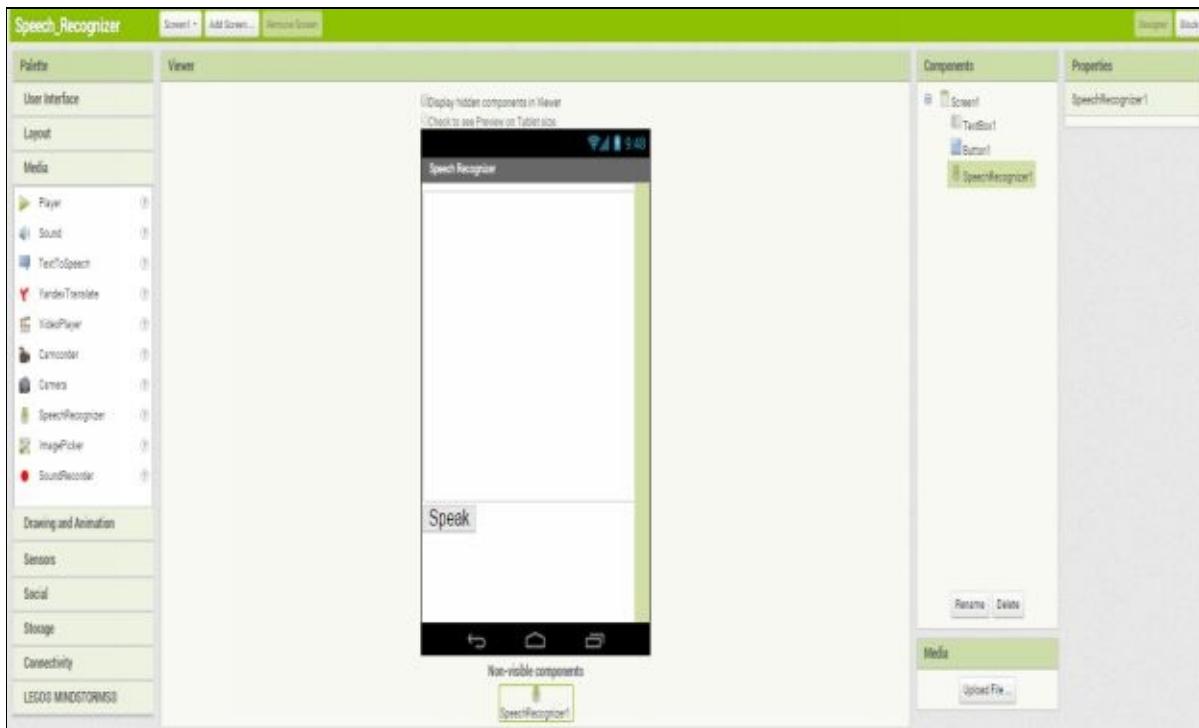

## 3. Now Drag a TextBox from Palette to Viewer screen and set its Width to Fill Parent and Height to 70 percent and change Hint to 'Your Text'.

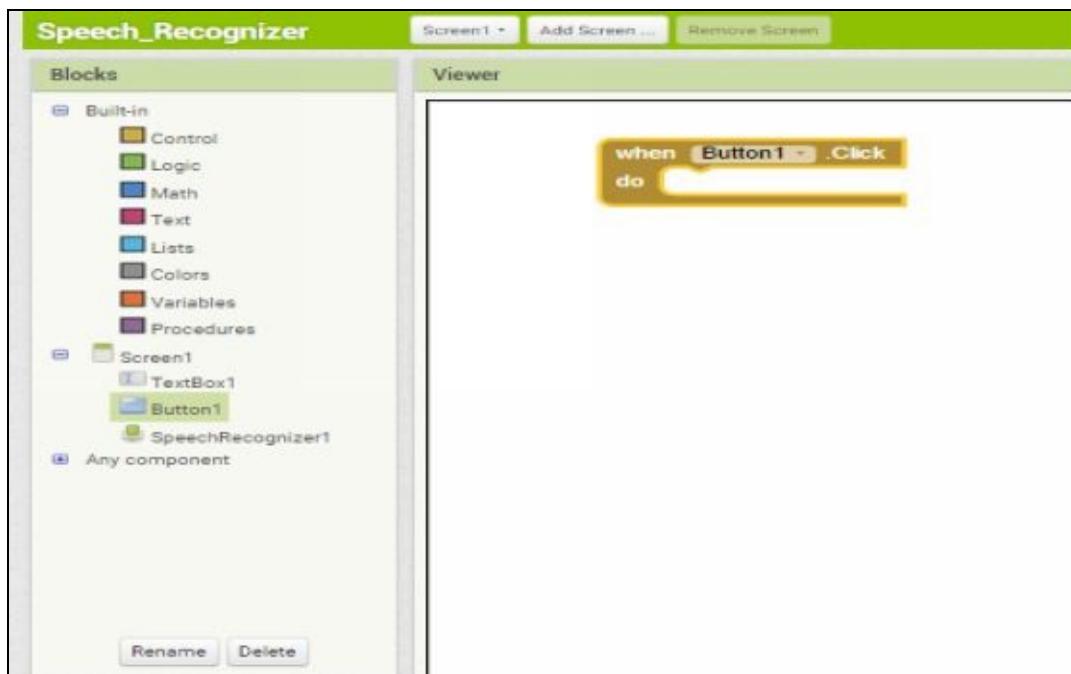

4. Now drag a **Button** from **Palette** to **Viewer** screen and change it's **Text** to **Speak** and **FontSize** to **24.0**.

5. Drag a **SpeechRecognizer** (Non-Visible) component from **Palette** to **Viewer** screen.

6. Go to **Blocks** and Click on **Button1** and select block. This is an event block which will decide what your app will do when this button will be clicked. Here click is an event for Button1 component.

7. Click on **SpeechRecognizer1** and select these **blocks**. These blocks will open your phone's microphone and convert your speech to Text.

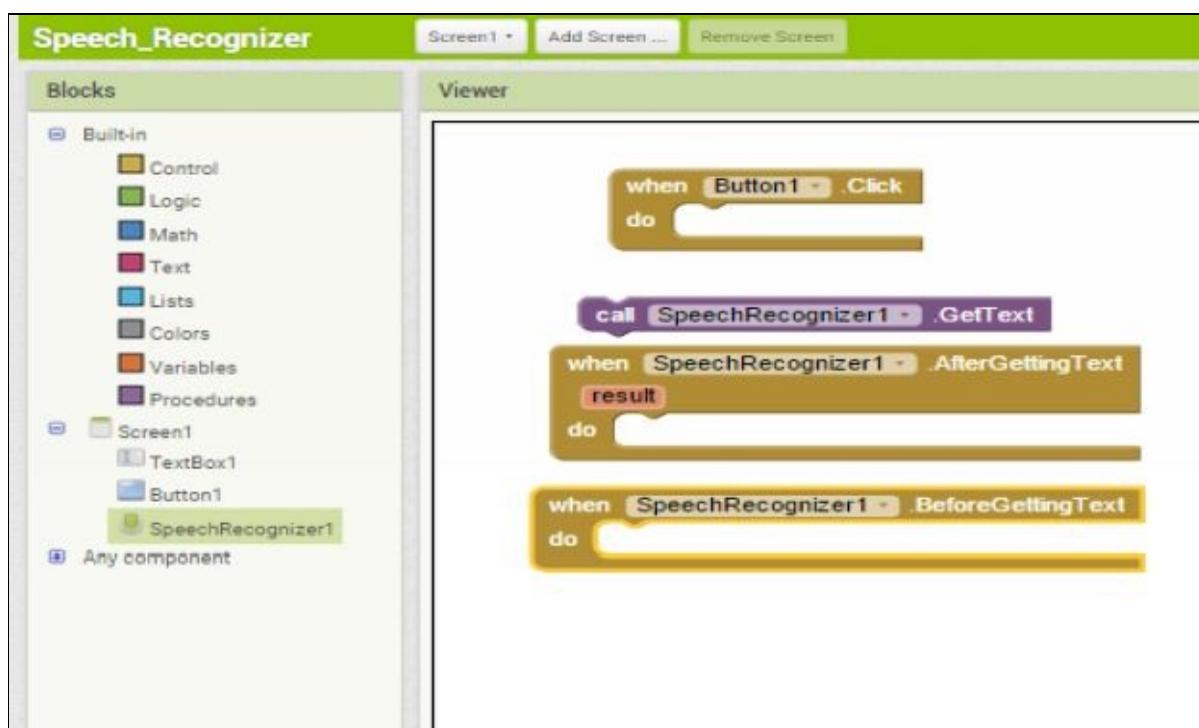

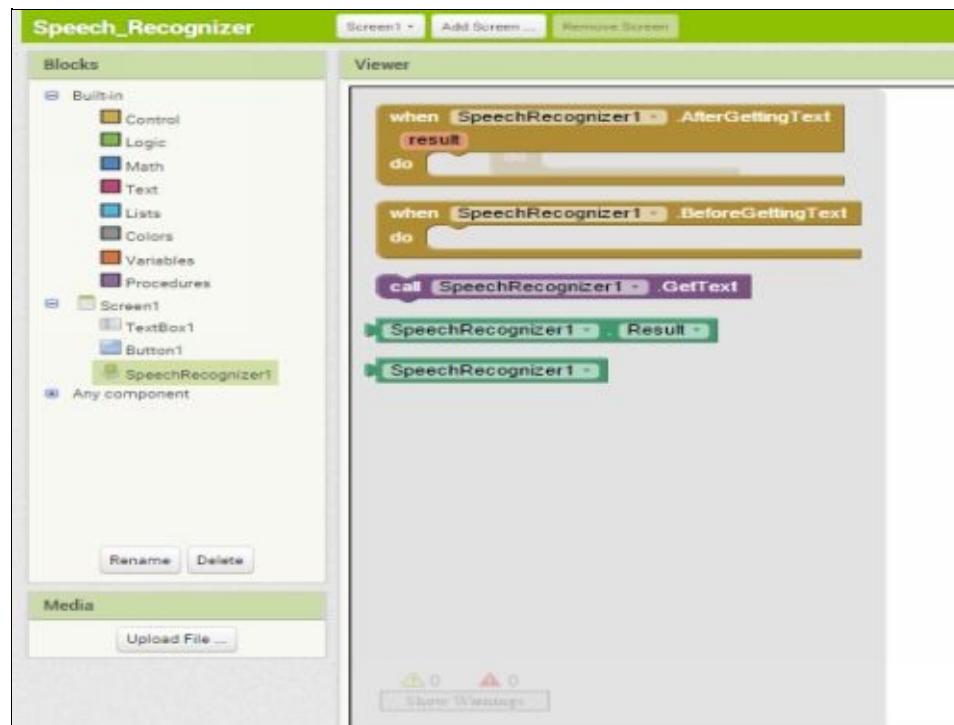

```

call SpeechRecognizer1 . .GetText

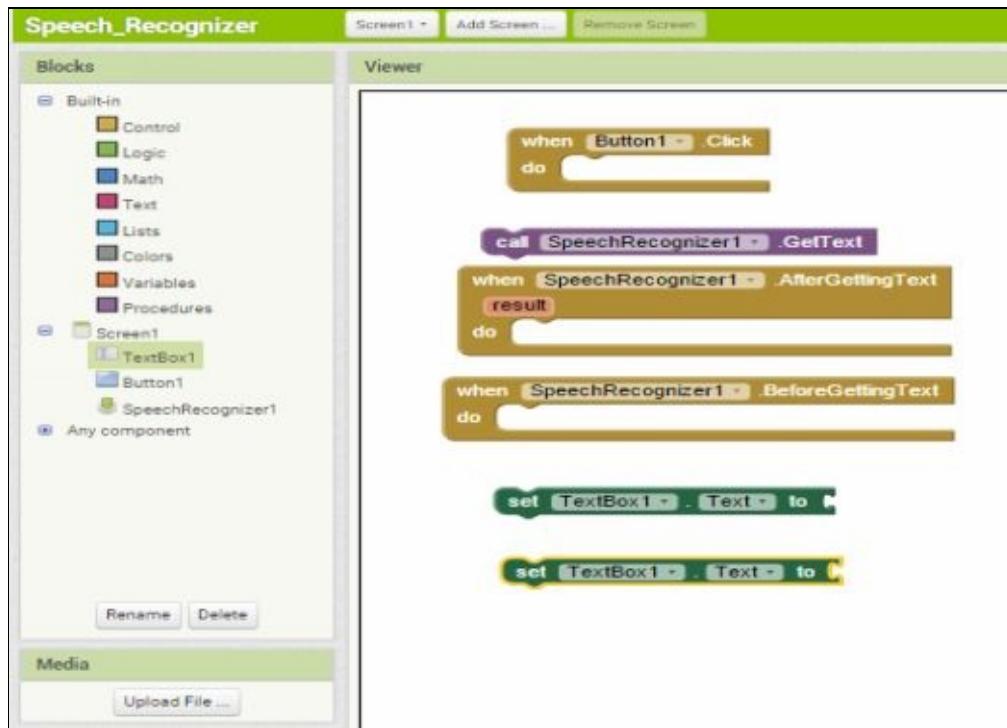

when SpeechRecognizer1 . AfterGettingText
  result
  do [redacted]

when SpeechRecognizer1 . BeforeGettingText
  do [redacted]

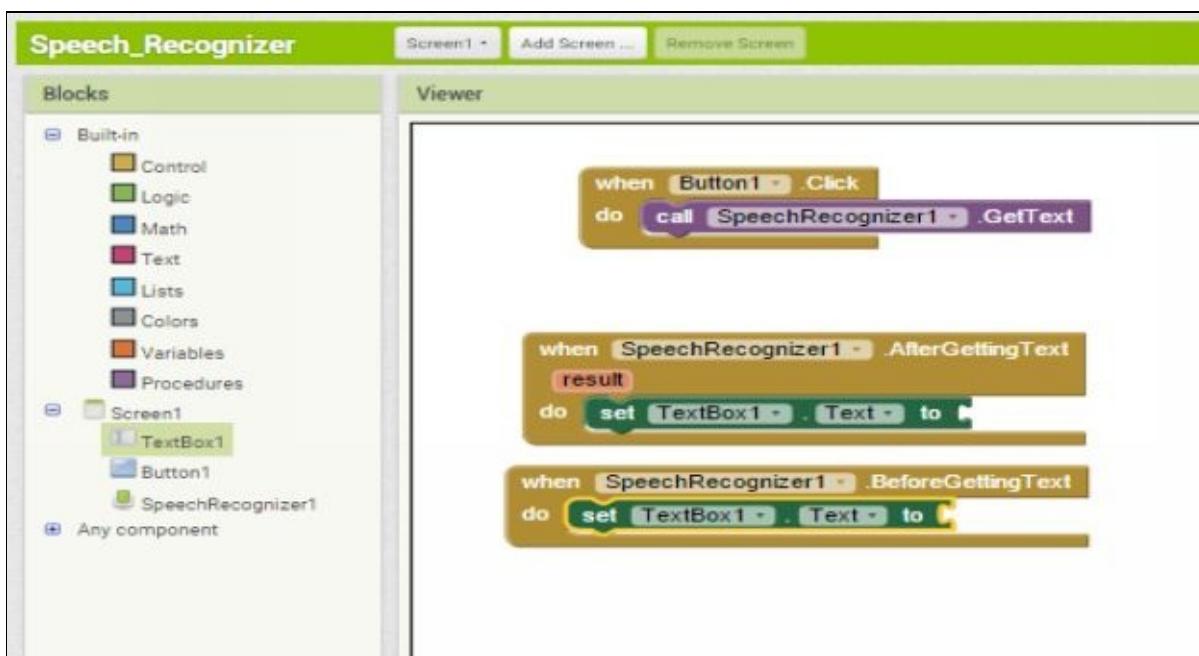

```

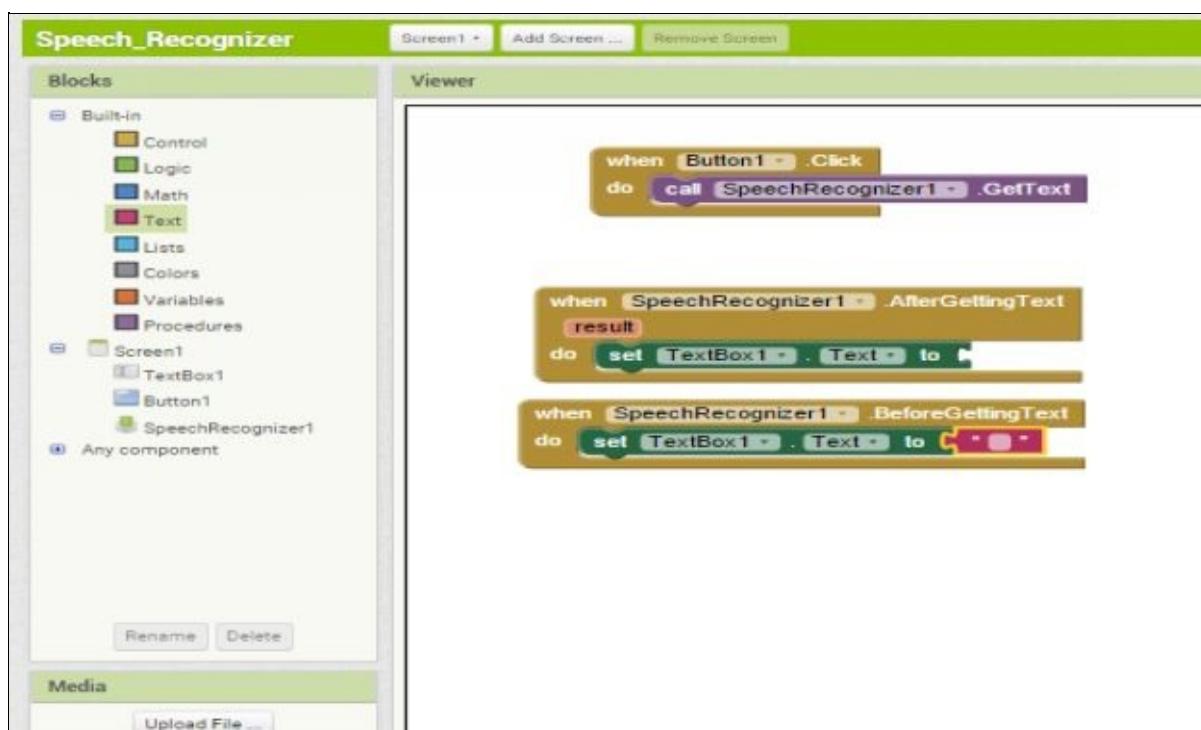

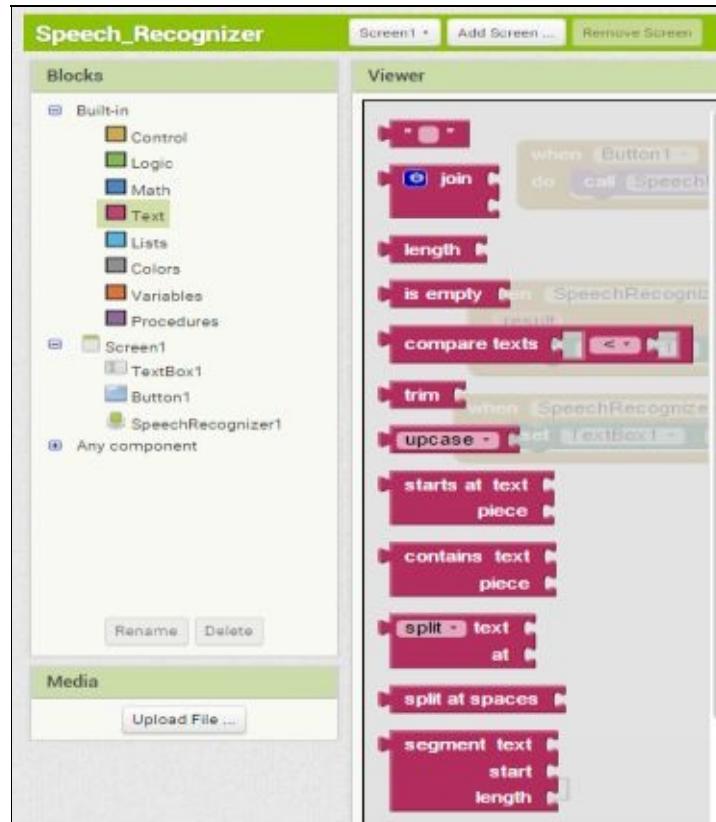

8. Now click on **TextBox1** and select block twice.

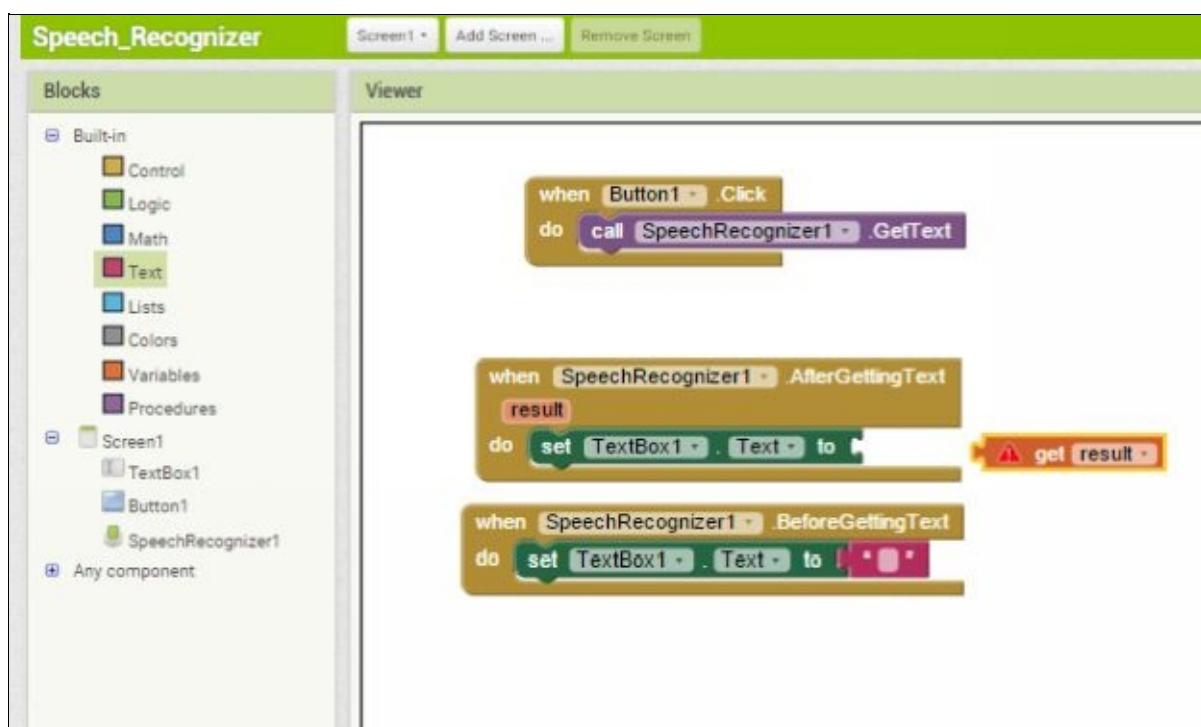

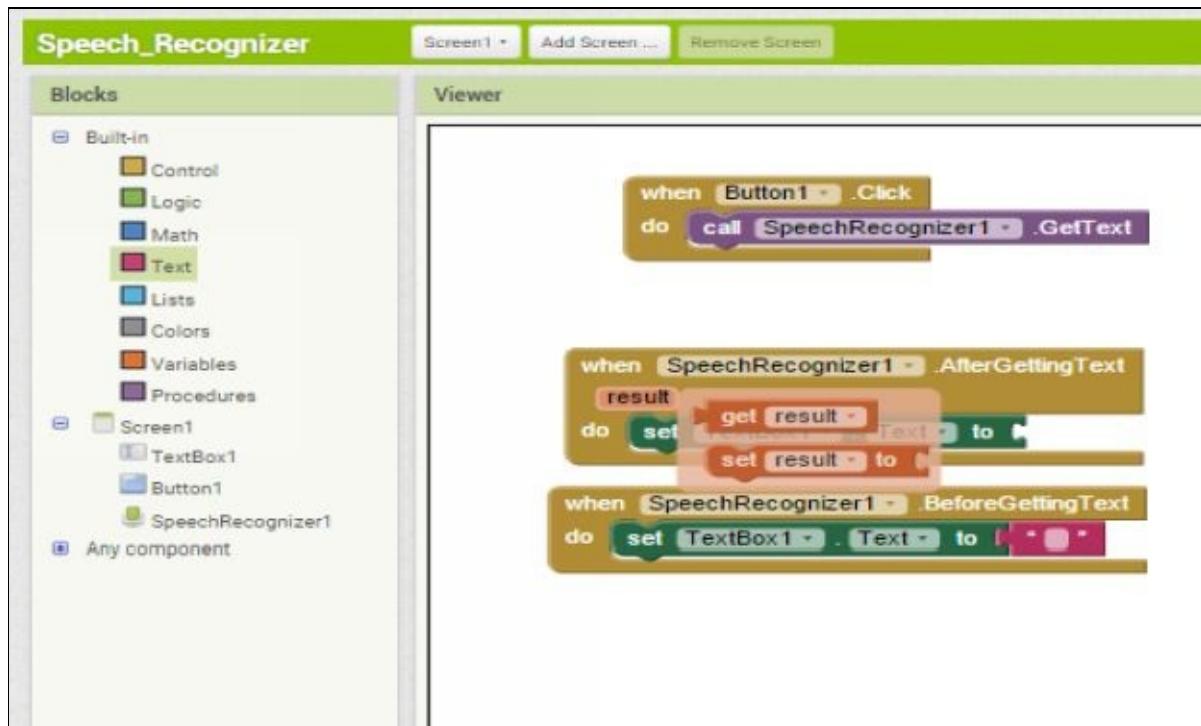

9. Attach the **blocks** as shown below. So when you click on Button1 ,app will open your device's microphone and then you can speak something.

10. Now click on **Text** under **Built-in** and select **block**.

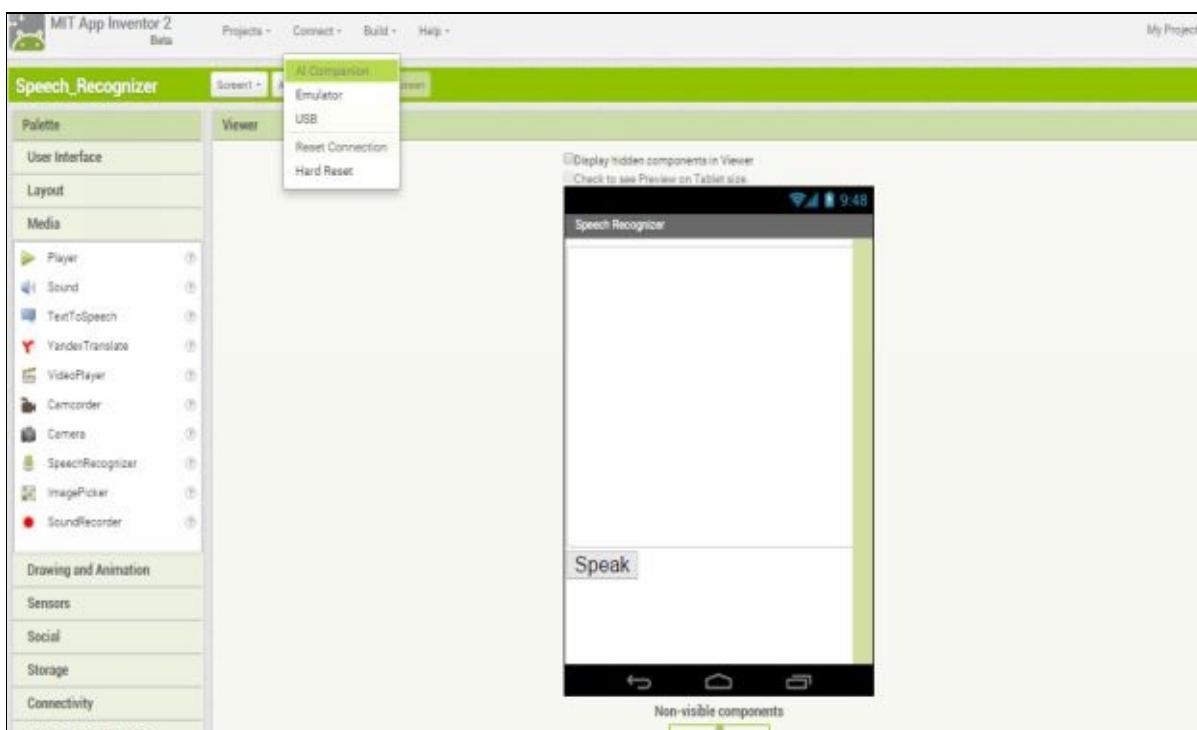

11. Now mouse over on **result** and click on **block**. This block contains the Text which you spoke.

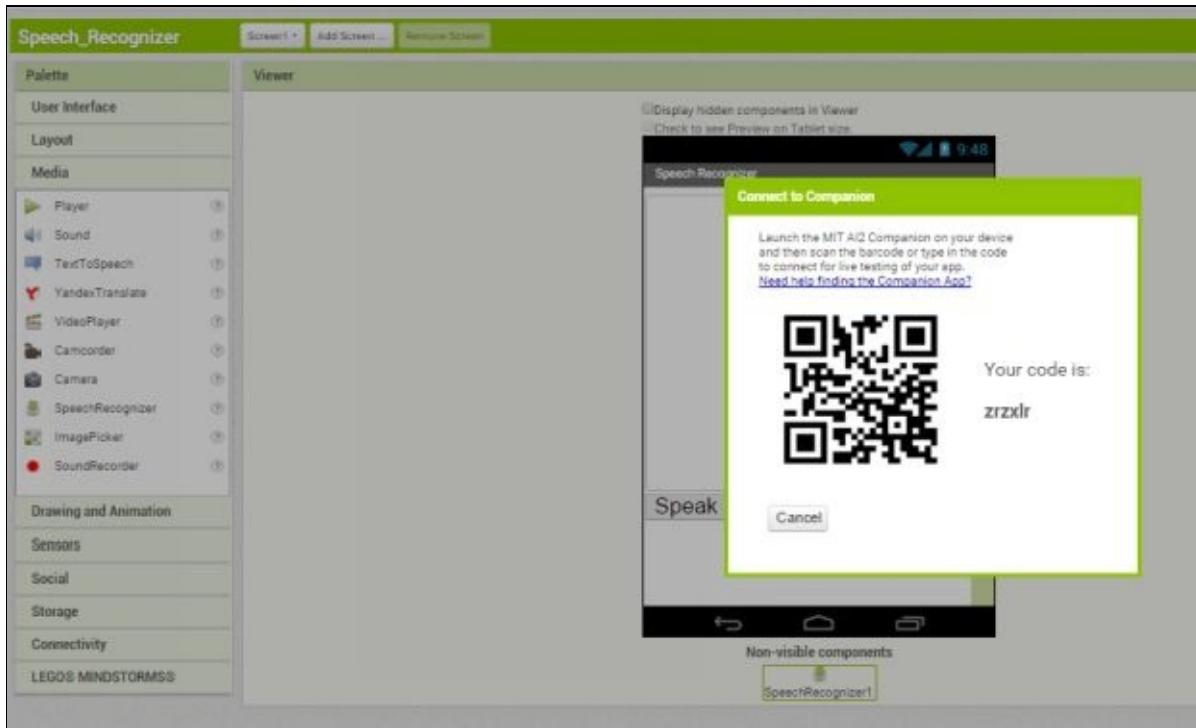

12. Attach the **blocks** as shown below. When you click Speak Button your app will open microphone and once you have completed speech, app will show the text in TextBox1 that you spoke.

13. Now go to **Designer** and click on **Connect** and select **AI Companion**.

14. Now open MIT App Inventor 2 Companion in your mobile/Tablet.

And enter the code or scan the [QR code](#) from your mobile and click on connect with code.

Note:- Your Mobile/Tablet should be connected to same wi-fi/network to which your computer/Laptop is connected.

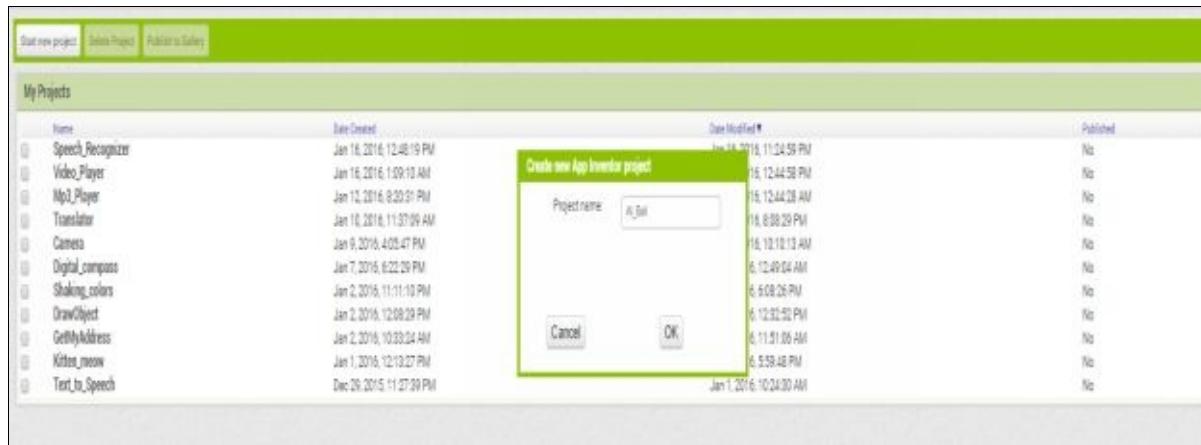

15. Now you should see your app in your phone for live testing. Click on **Speak Button** and **Speak** You should see the text in **TextBox** that you spoke.

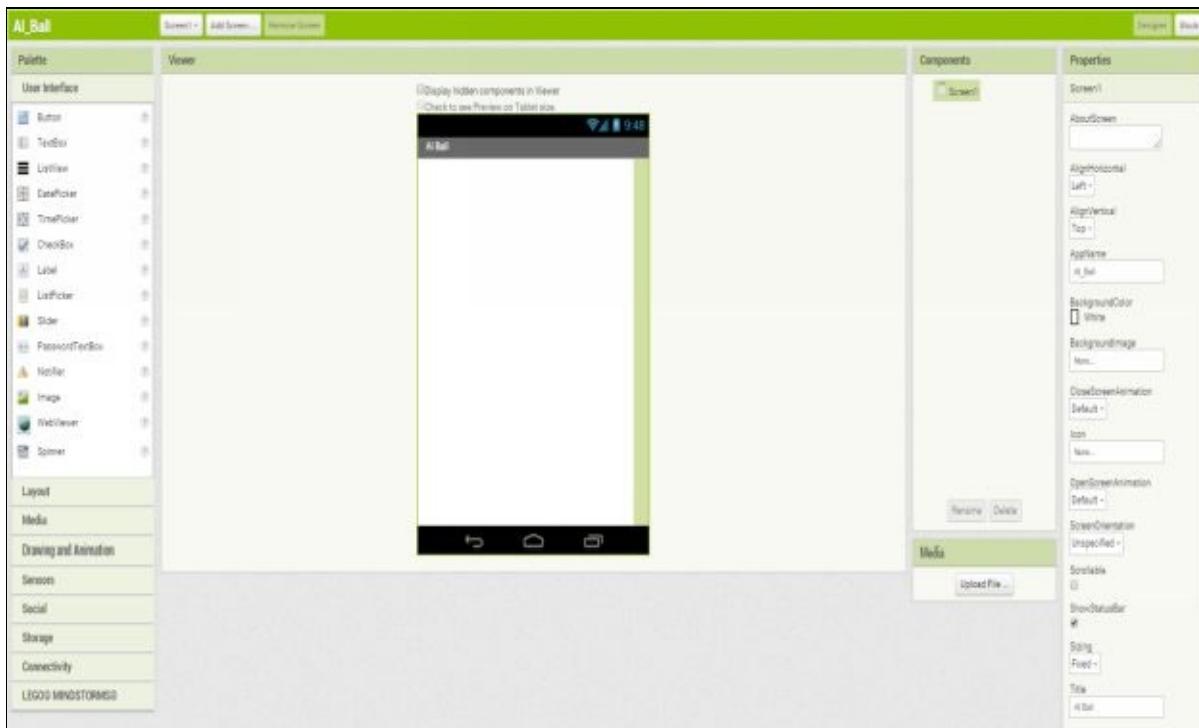

## Chapter 15: AI Ball App

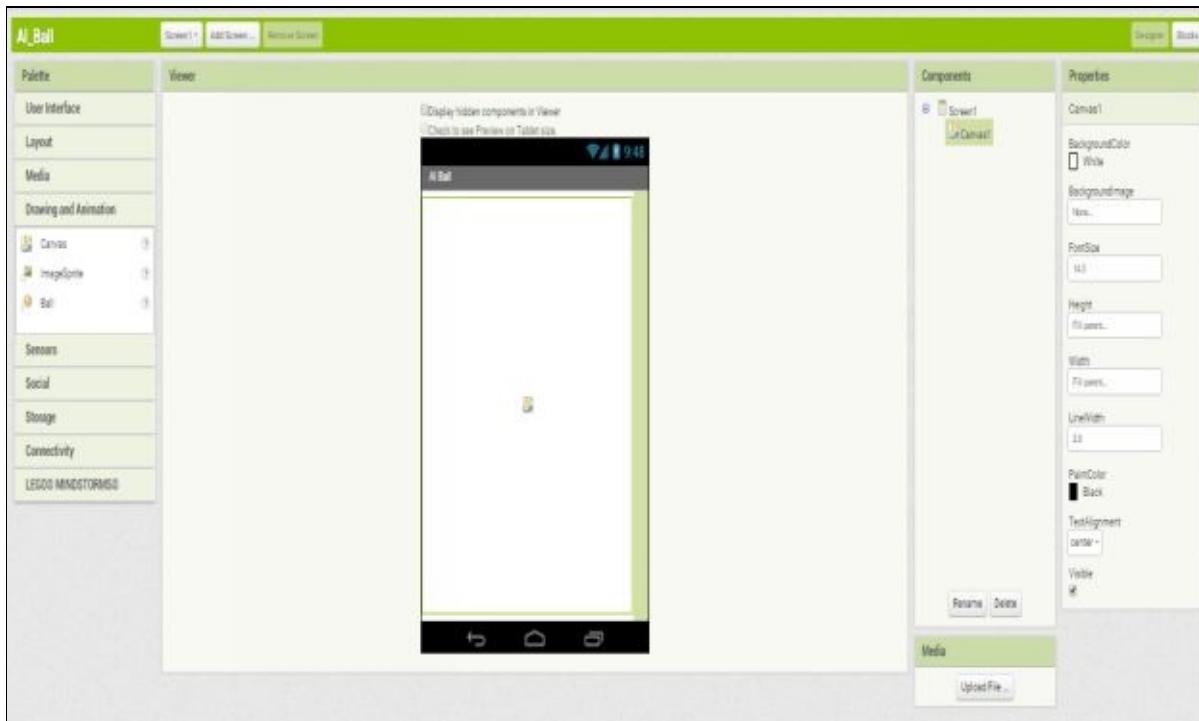

1. Click on **Start new project** and give it name **AI\_Ball** and Click **OK**.

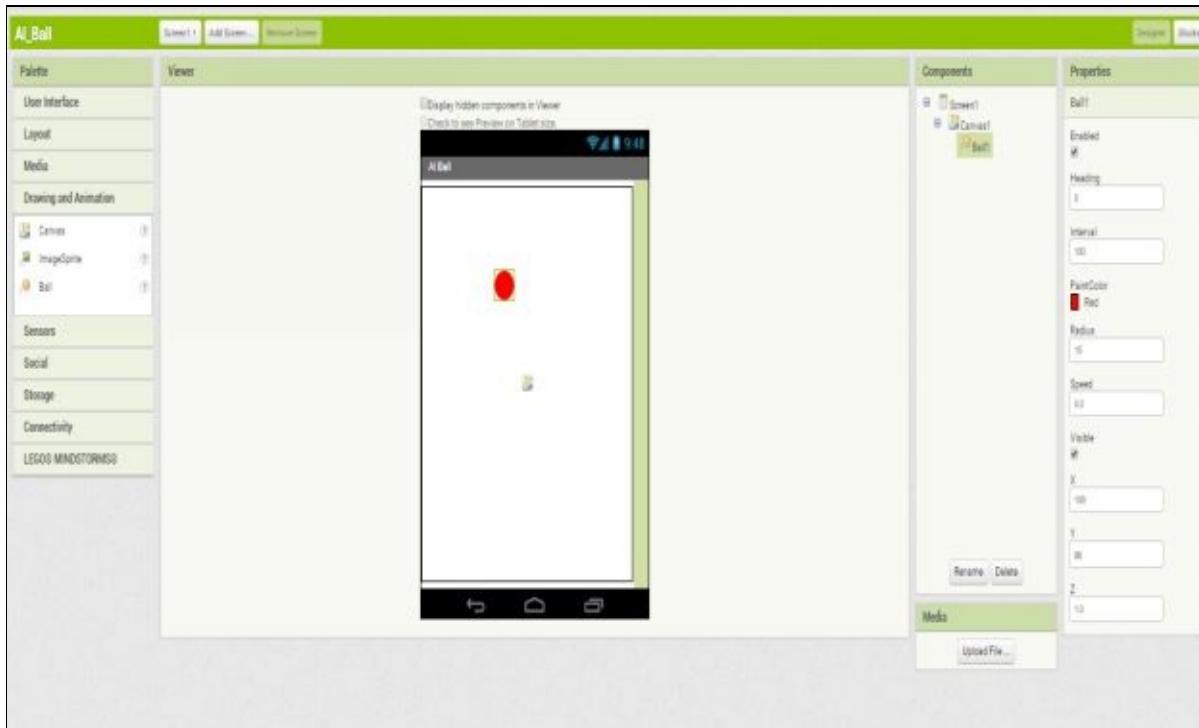

2. Change **Screen1 Title** to **AI Ball**.

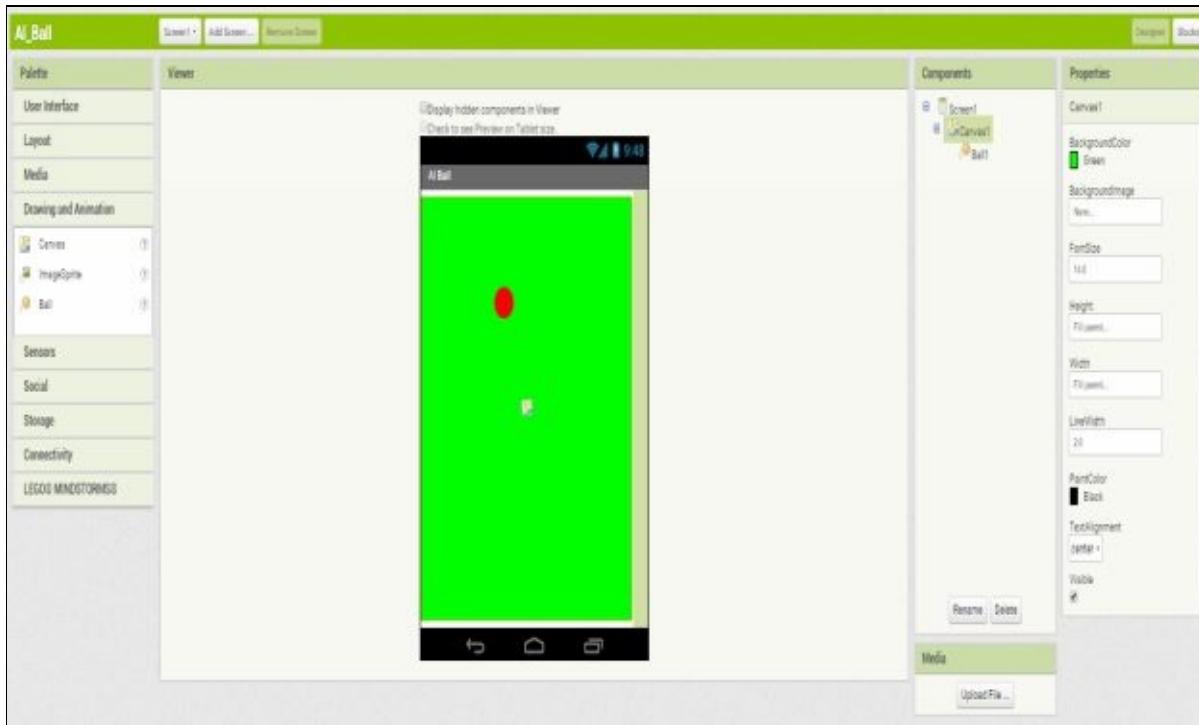

3. Drag a **Canvas** from Palette to **Viewer** screen and set its **Height** and **Width** to **Fill Parent**.

4. Drag a **Ball** inside the **Canvas1** and set it's **radius** to **15**. And set its **PaintColor** to **Red**.

5. Now click on **Canvas1** and change it's **BackgroundColor** to **Green**.

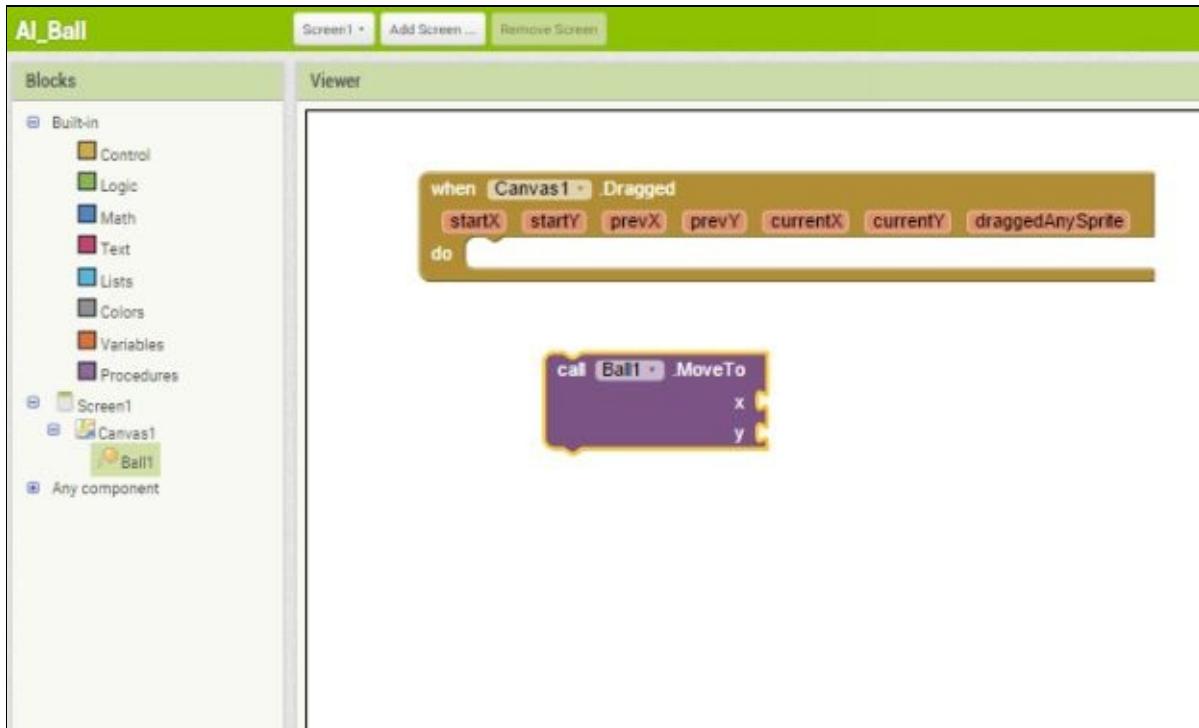

```
when Canvas1 .Dragged
  startX startY prevX prevY currentX currentY draggedAnySprite
  do [ ]
```

6. Now go to **Blocks** and click on **Canvas1** and select **block**. This block will identify dragging activity on your canvas and decide what to do when dragged.

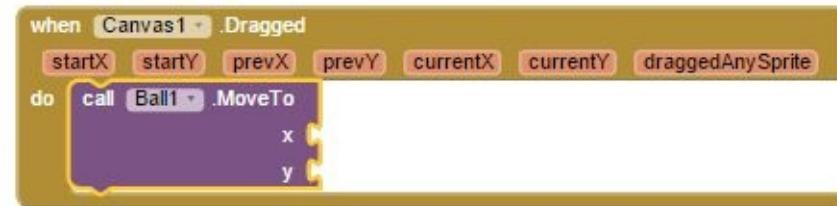

7. Now click on **Ball1** and scroll down to select block. Every point on Screen is represented by X and Y co-ordinates. This block will move the ball to some point on screen represented by X and Y co-ordinates.

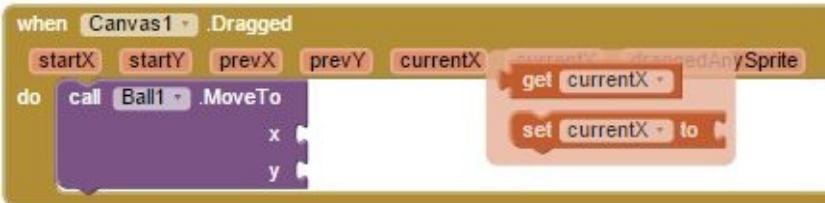

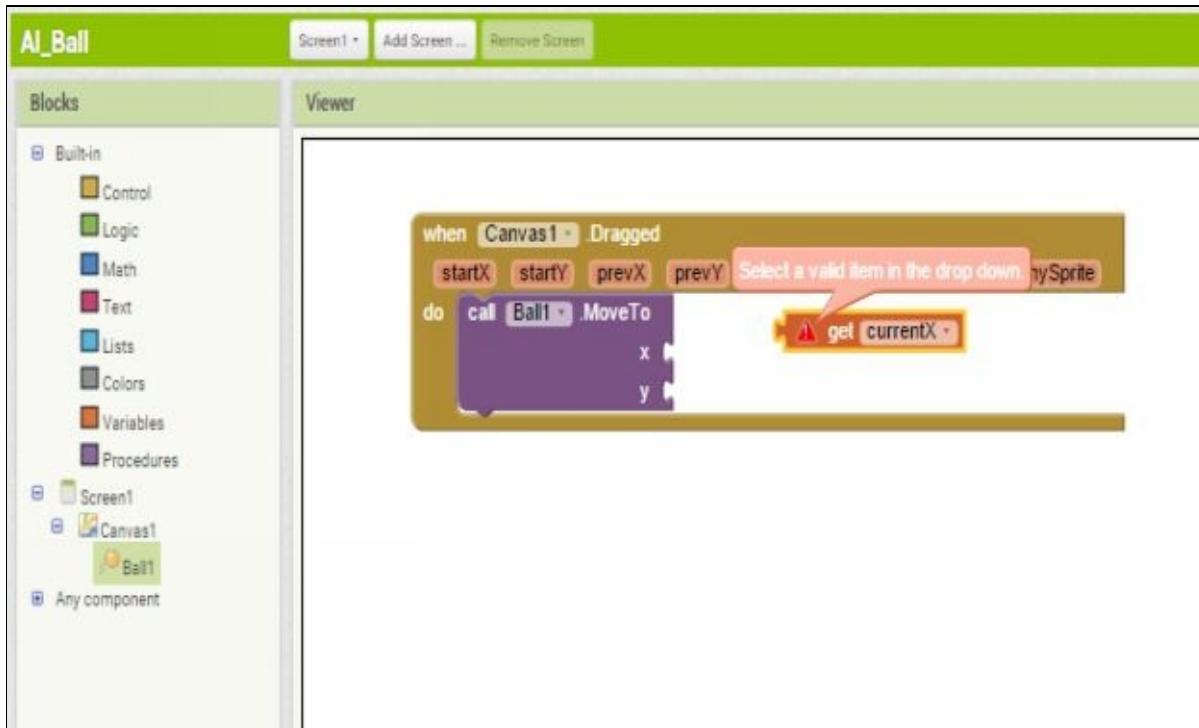

8. Attach the **blocks** as shown below. So that when you drag on the canvas your app will move the ball with your touch impressions on the canvas.

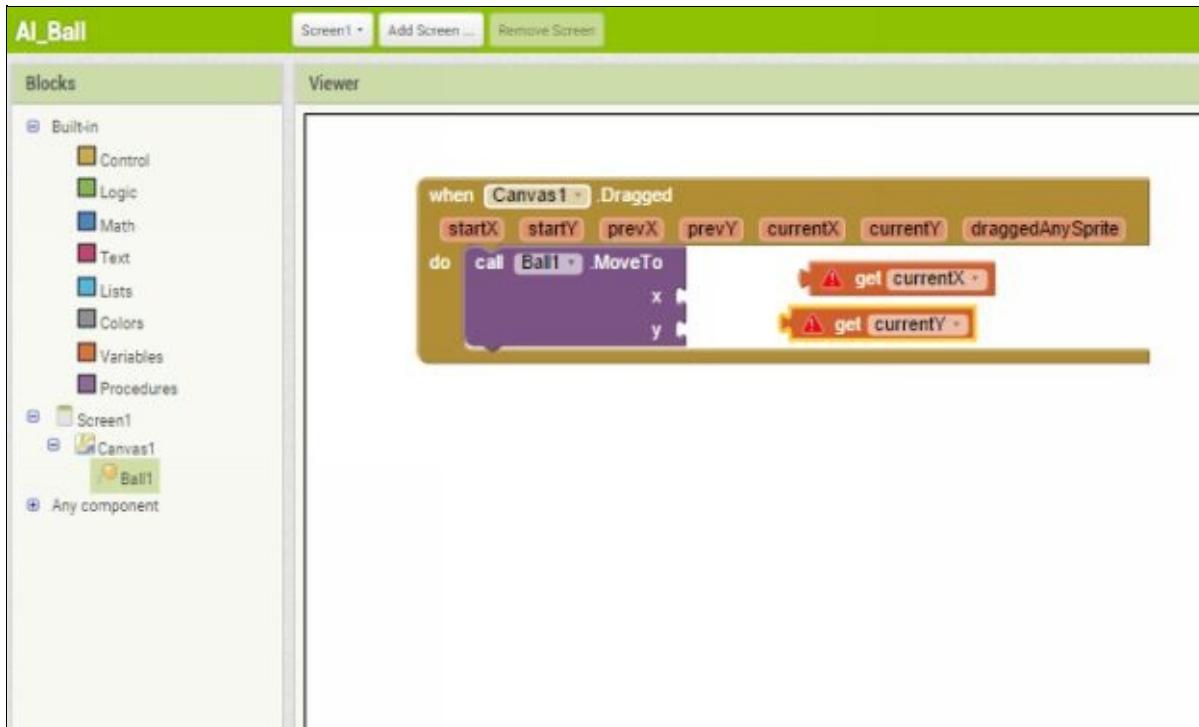

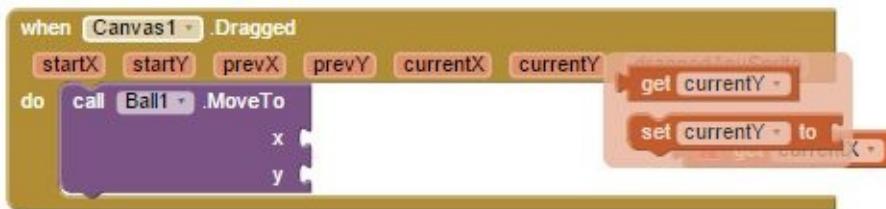

9. Now Mouse over on **currentX** to get **get currentX** block. Here **currentX** and **currentY** represents X and Y coordinates of the Touchpoint on canvas.

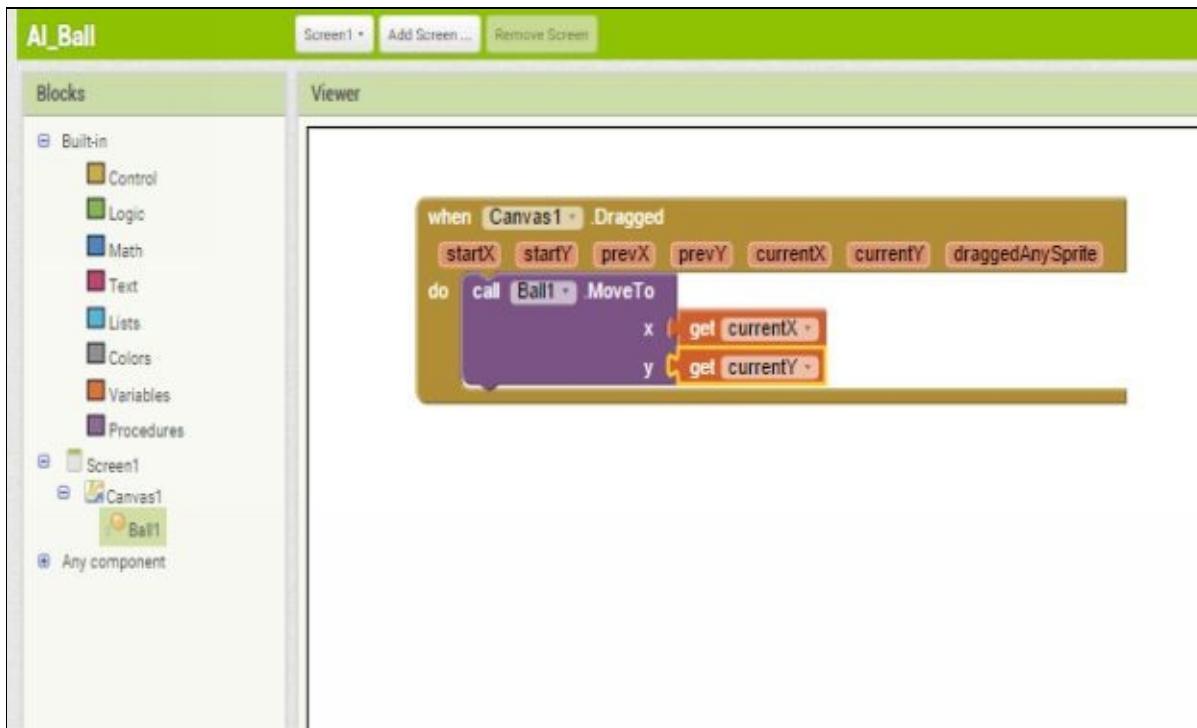

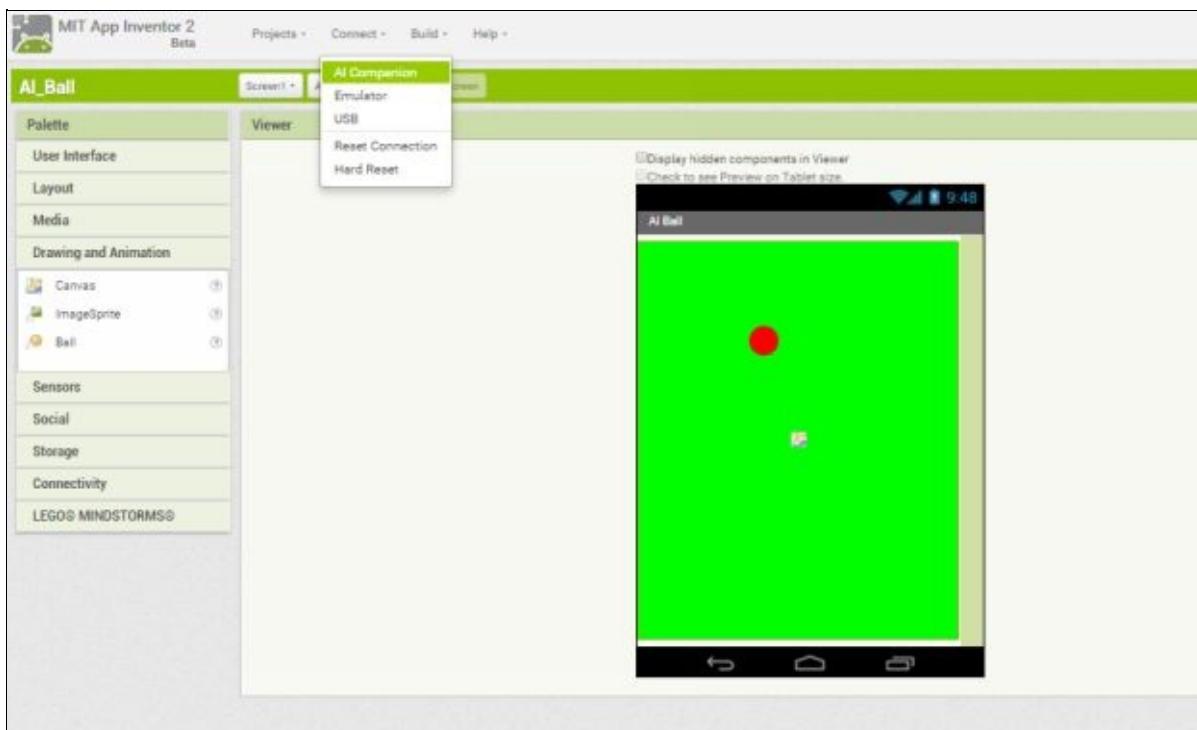

10. Similarly Mouse over on **currentY** and get **block**.

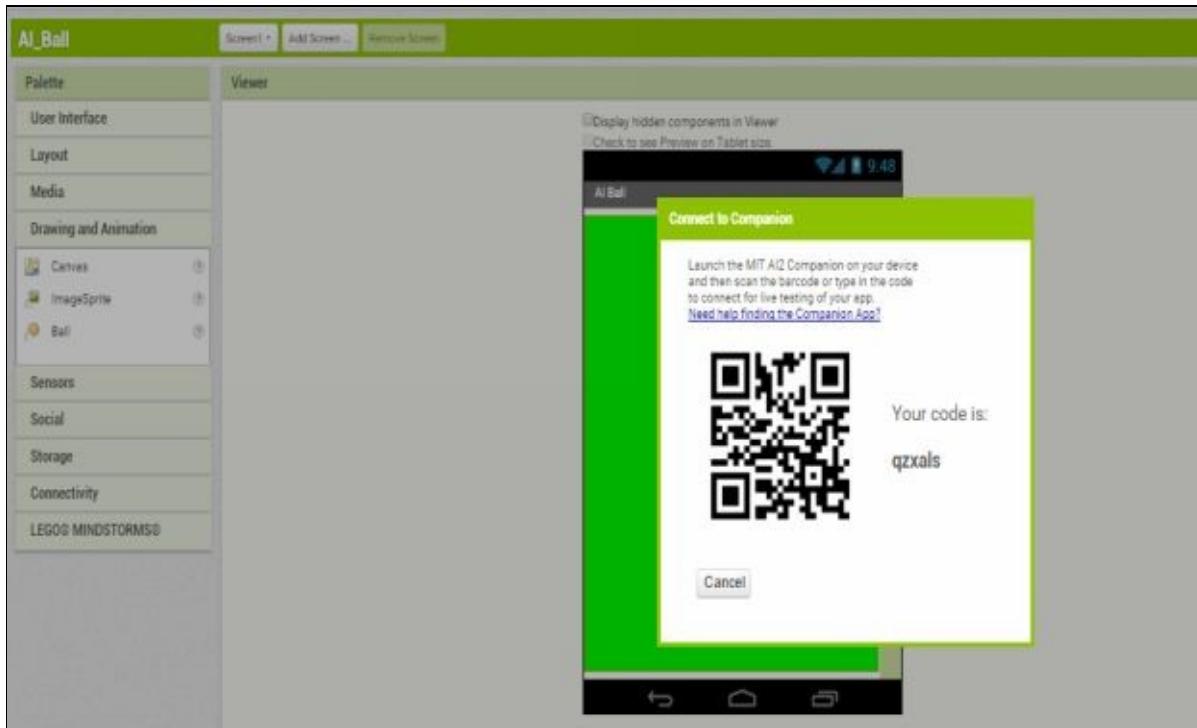

11. Now attach the **blocks** as shown below. So that your app will move the ball to the point you touch on the screen and move it with your finger on app screen.

12. Now go to Designer and click on Connect then click on AI Companion.

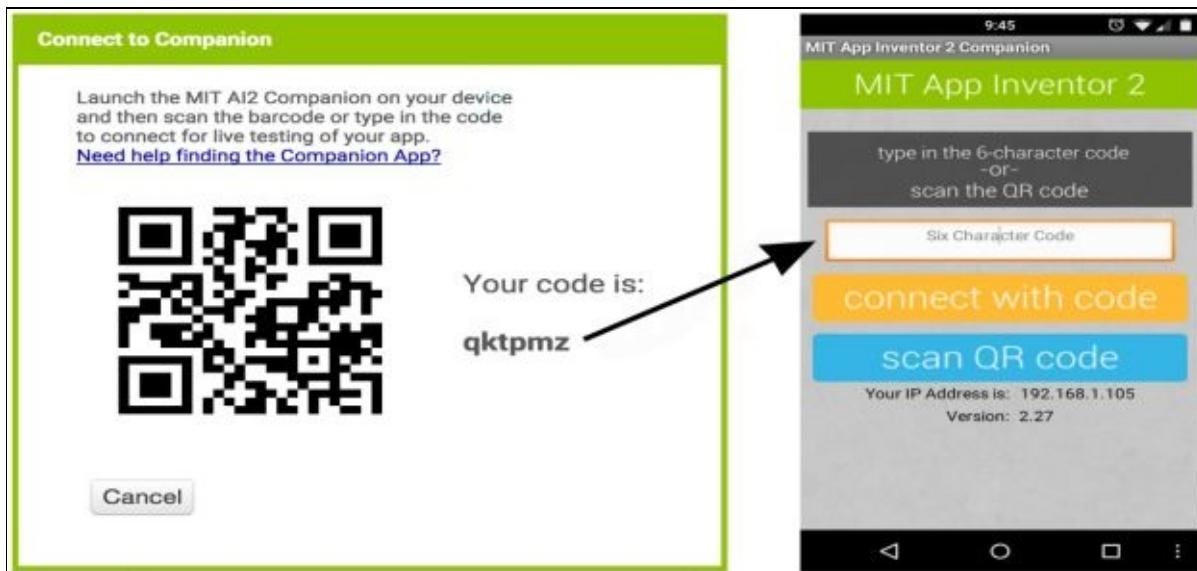

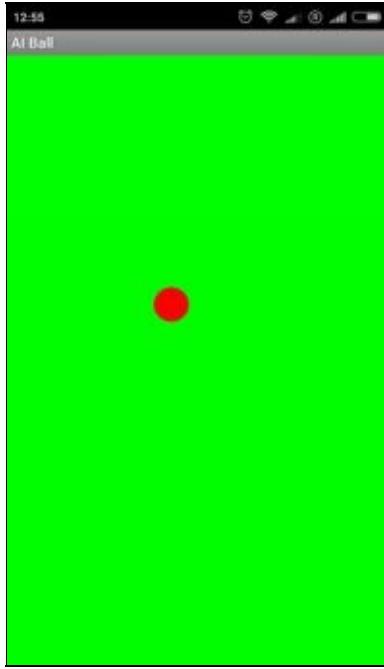

13. Now open MIT [App Inventor 2 Companion](#) in your mobile/Tablet.

And enter the code or scan the [QR code](#) from your mobile and click on connect with code.

Note:- Your Mobile/Tablet should be connected to same wi-fi/network to which your computer/Laptop is connected.

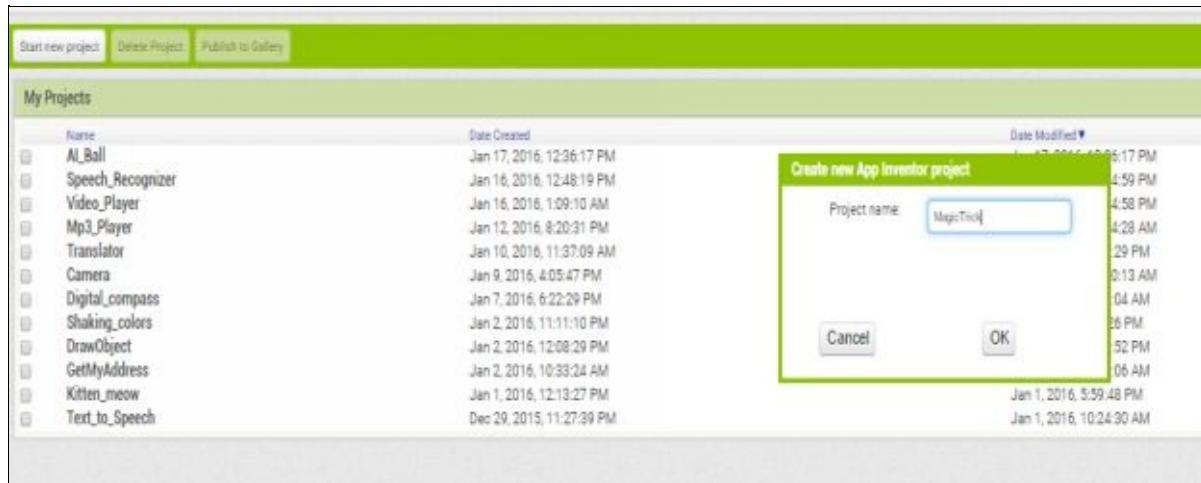

14. Now you should see your app in your phone for live testing. [Touch anywhere on the screen and drag it to move the Ball.](#)

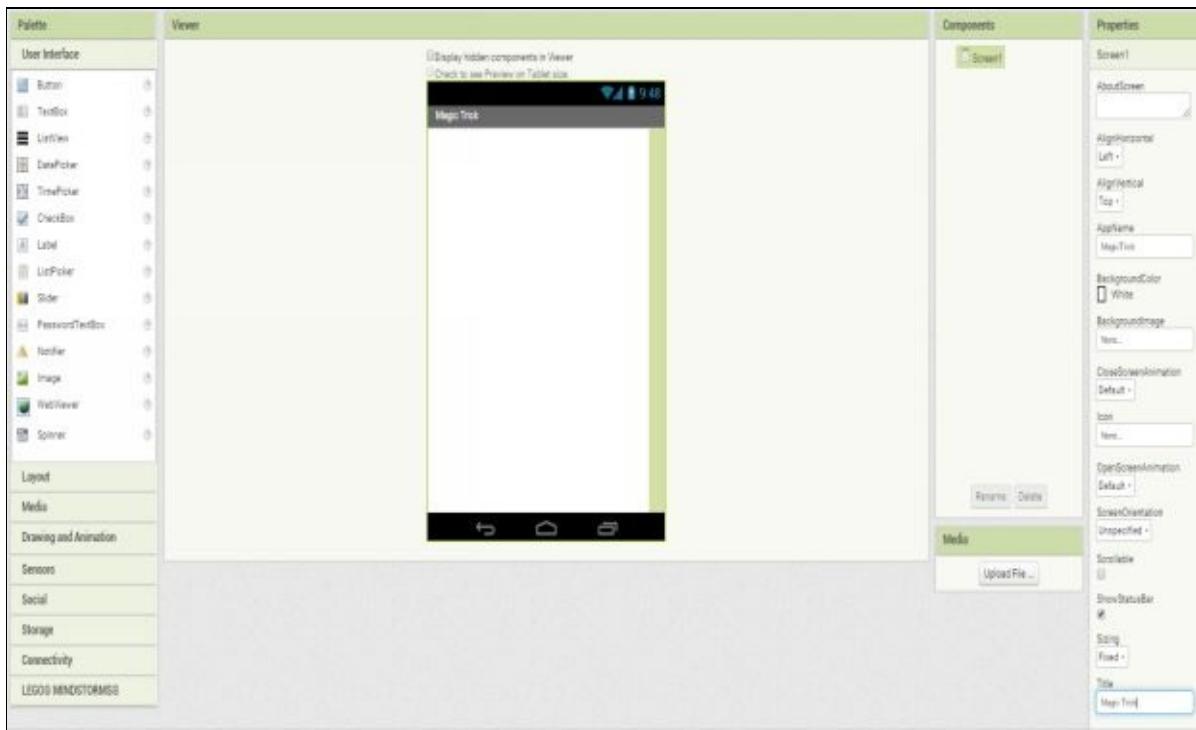

## Chapter 16: Magic Trick App

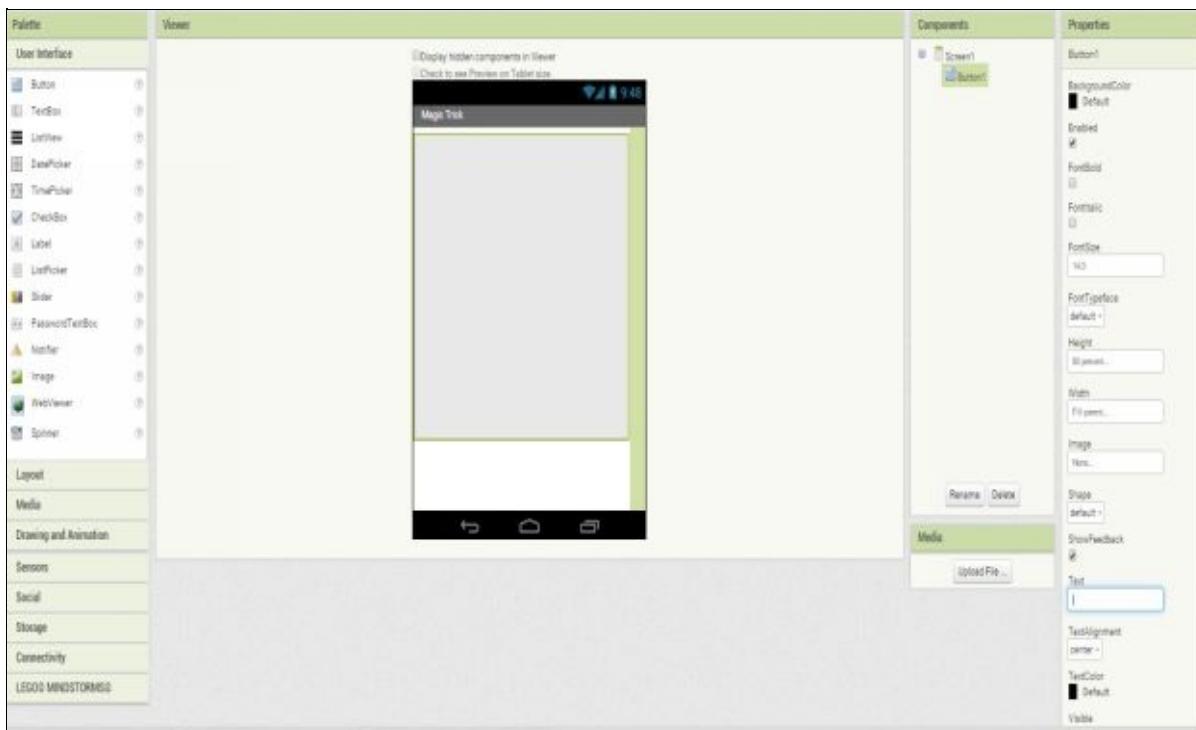

1. Click on **Start new project** and give it name **MagicTrick** and Click **OK**.

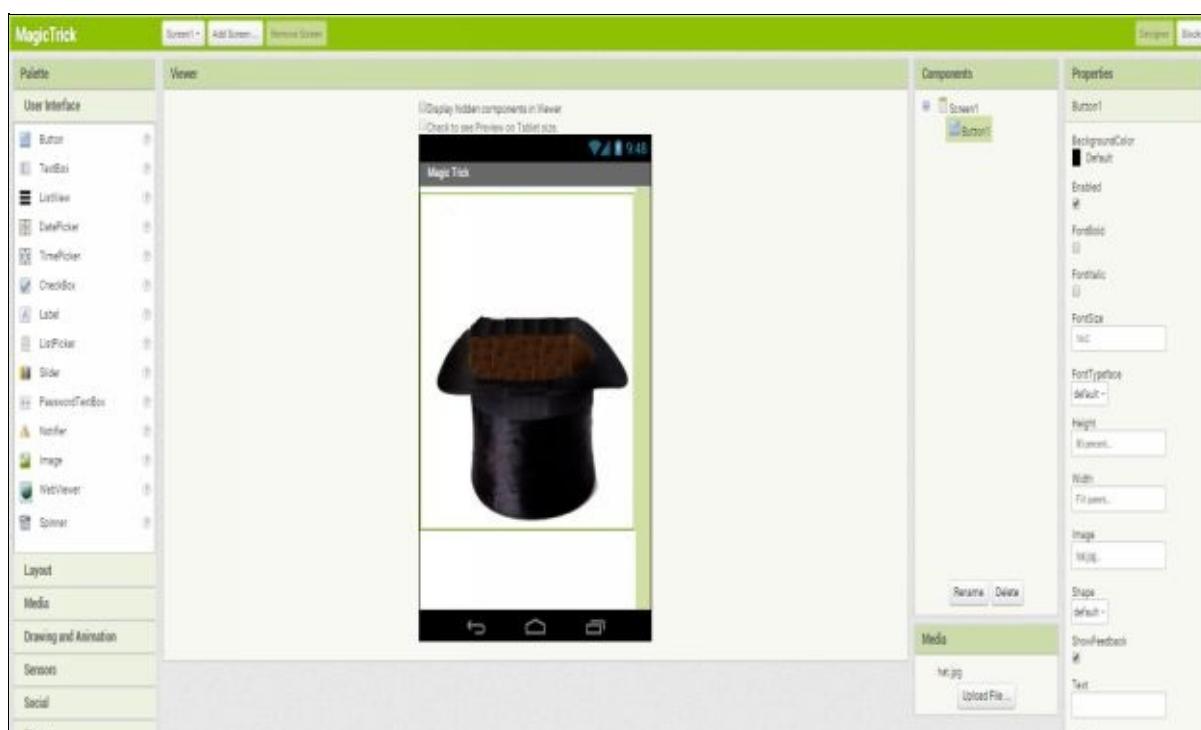

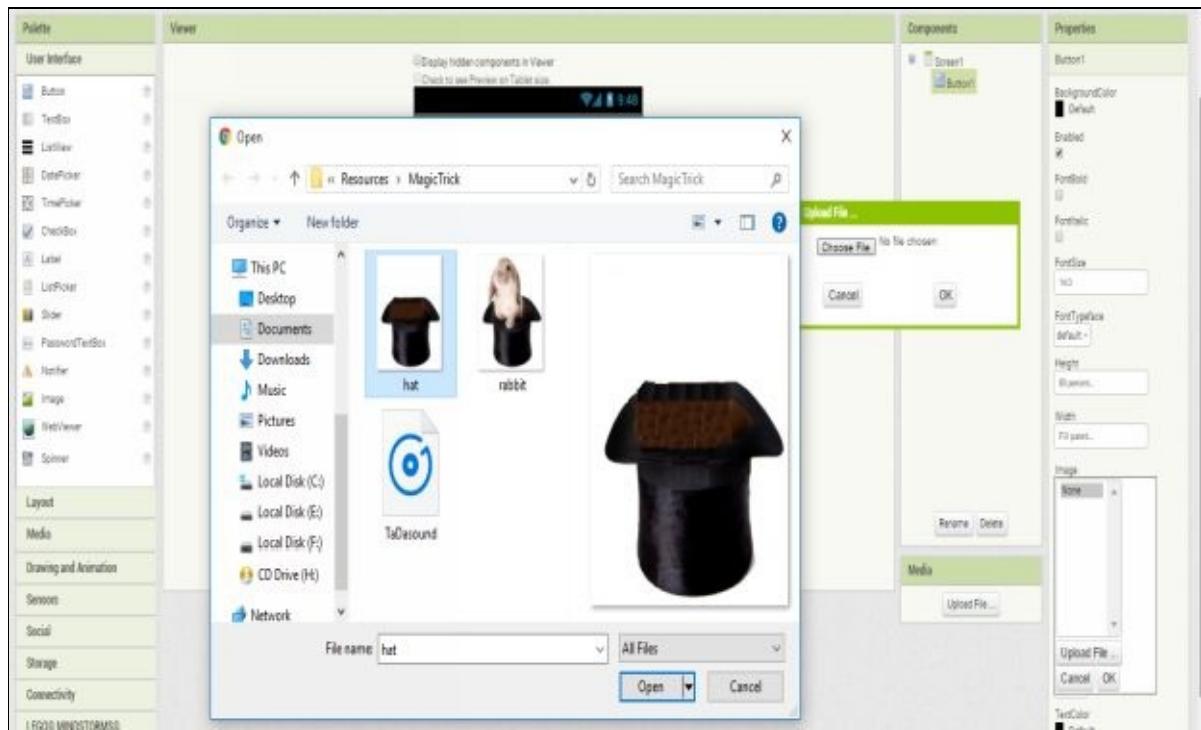

2. Change **Screen1 Title** to **Magic Trick**.

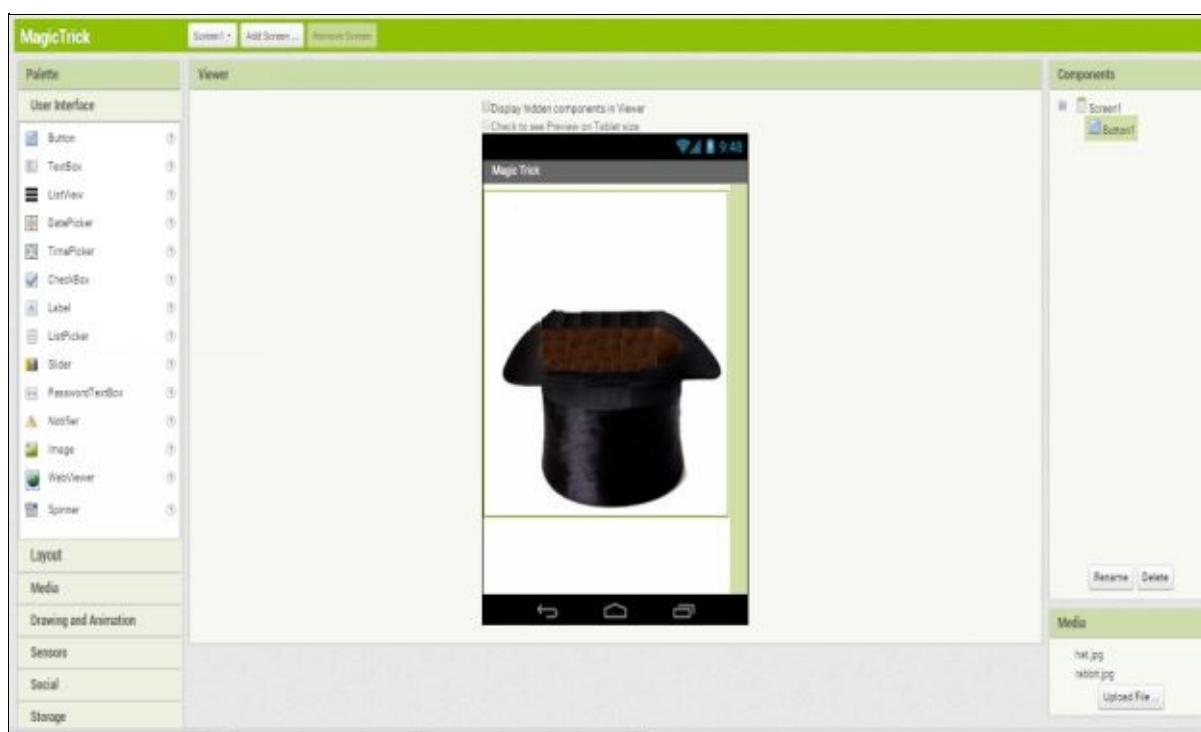

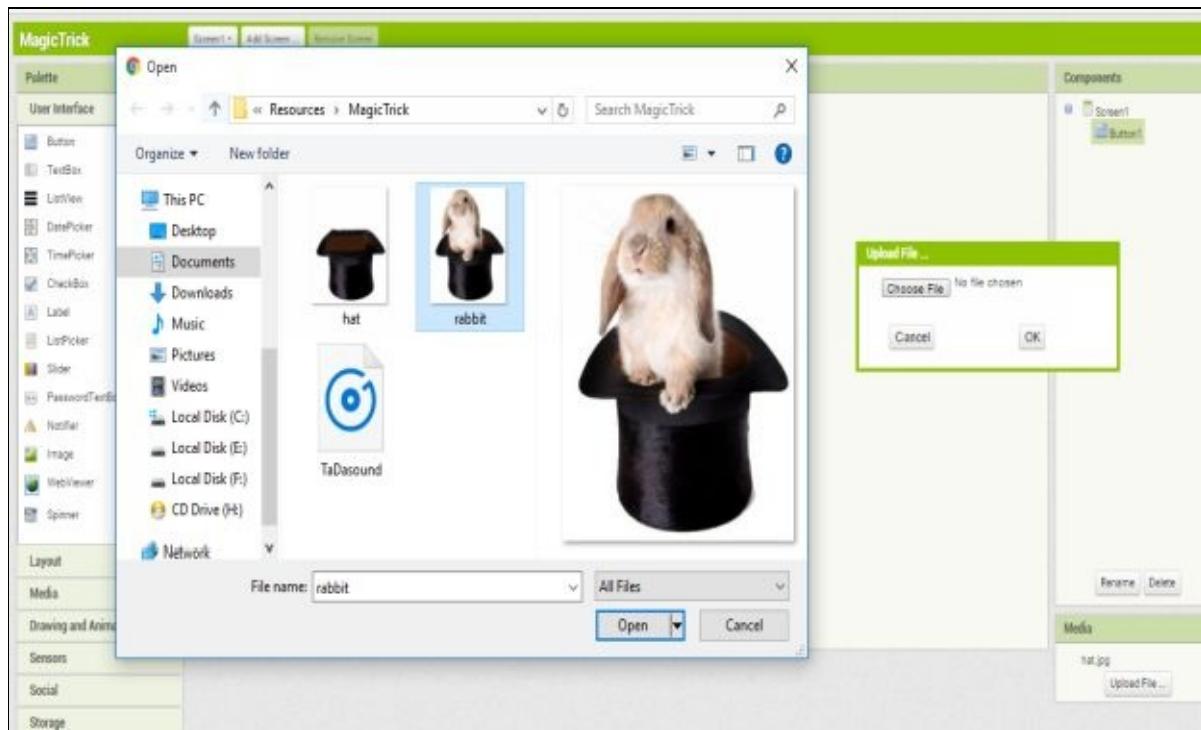

3. Now Drag a Button from Palette to Viewer screen and set its Height to 80 percent and Width to fill parent and Delete it's Text.

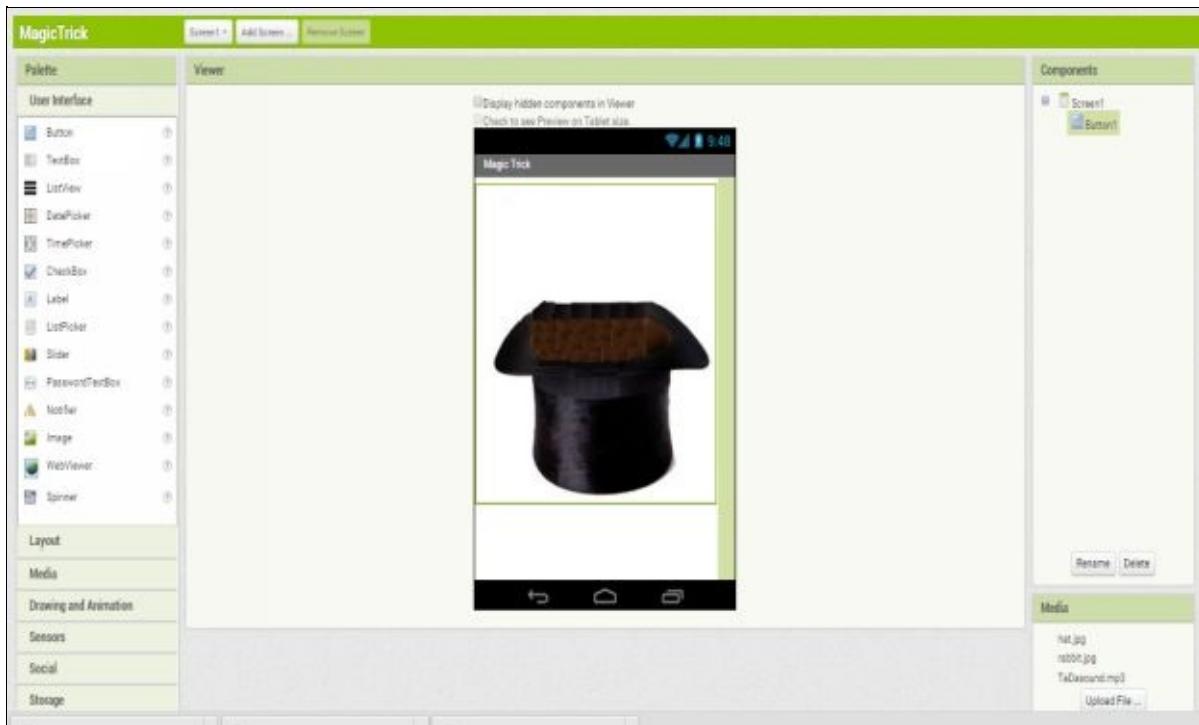

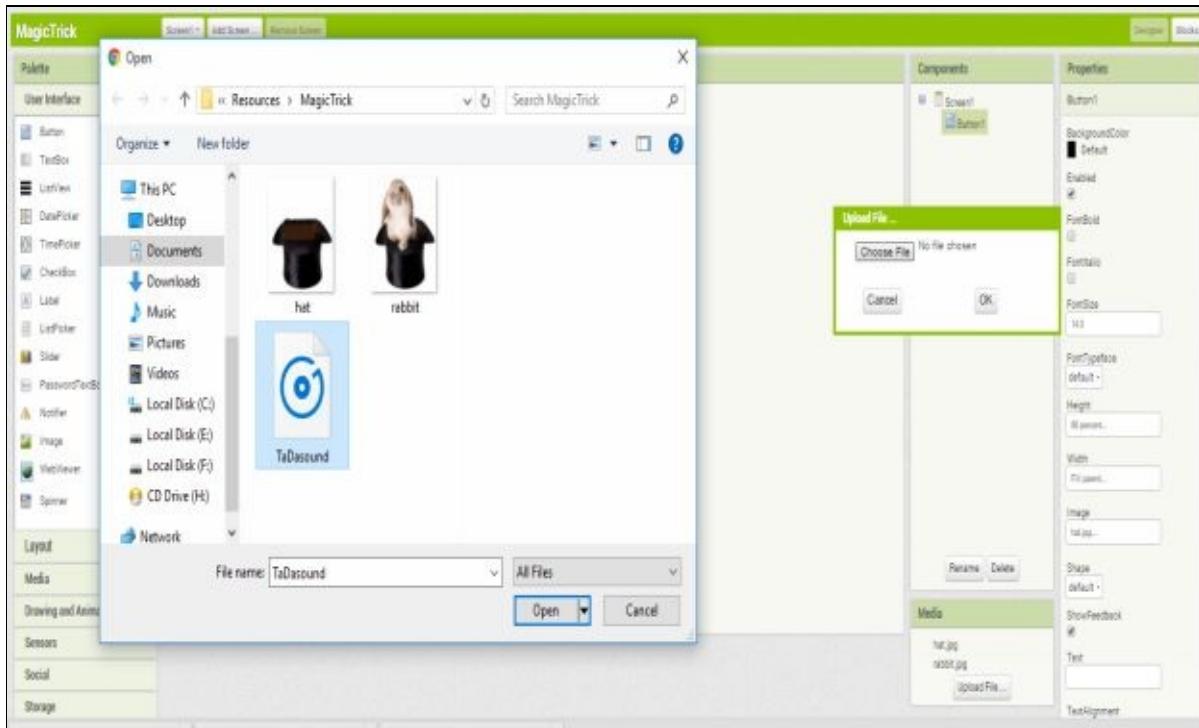

4. Now Change Button1 Image to **hat.jpg** and click **OK**.

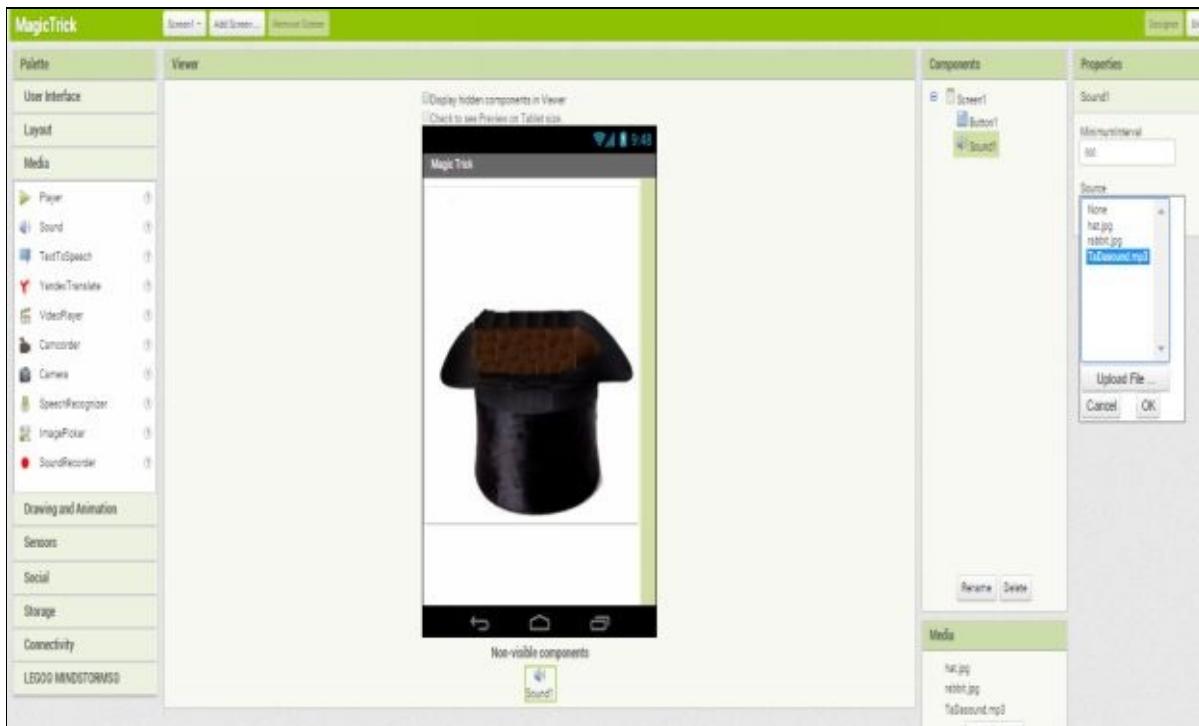

5. Click on **Upload File** button and upload **rabbit.jpg** image.

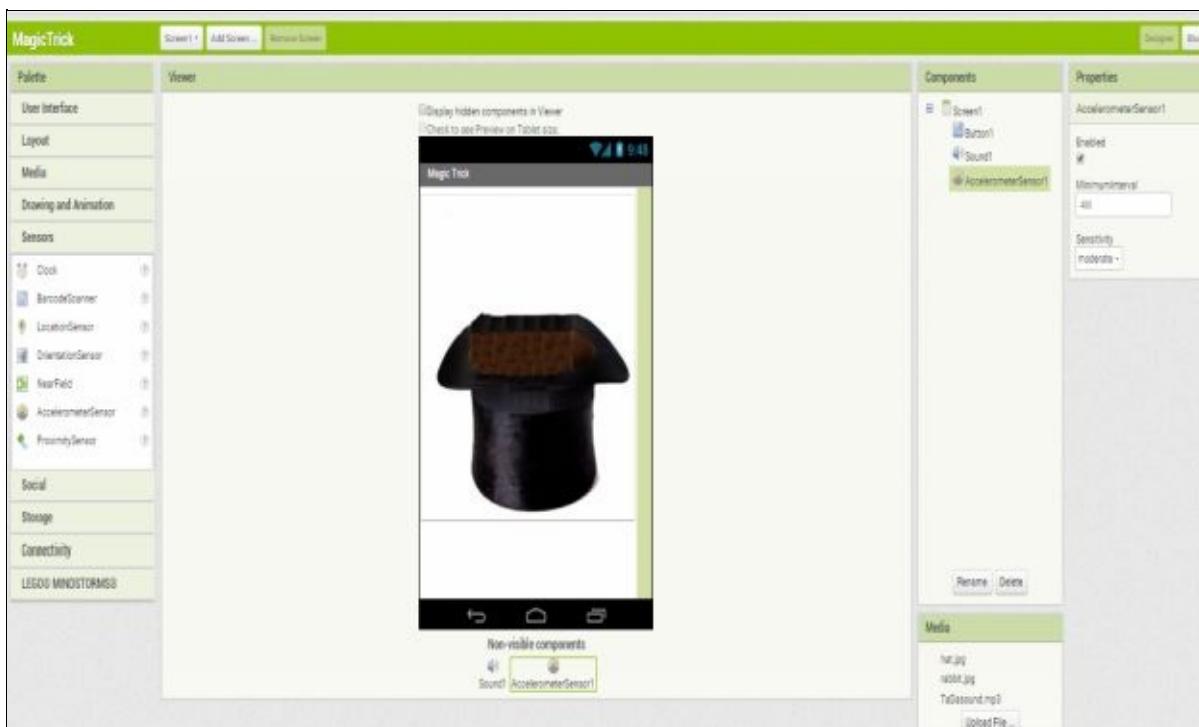

6. Click on **Upload File** button and upload **TaDasound.mp3**.

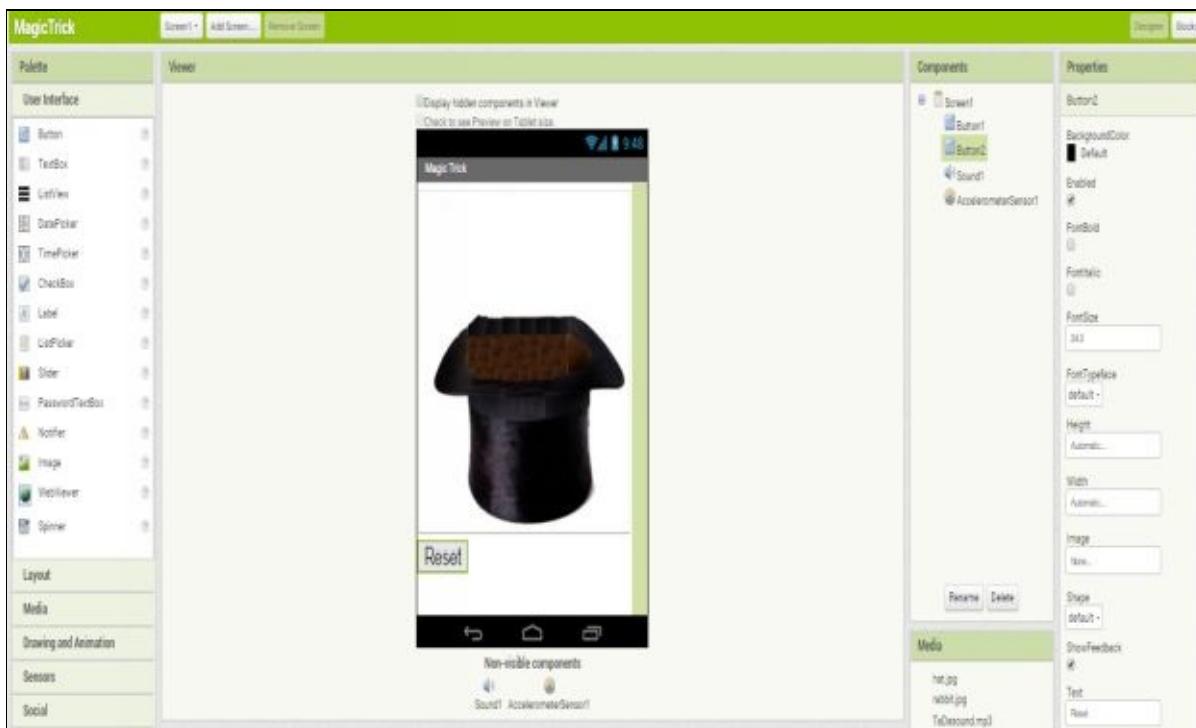

7. Now drag a **Sound** component from **Palette** to **Viewer** screen and select it's **Source** to **TaDasound.mp3** and click **OK**.

8. Now drag an AccelerometerSensor from **Palette** to **Viewer** screen.

9. Drag another Button from **Palette** to **Viewer** and change it's **Text** to **Reset** and **FontSize** to **24.0**.

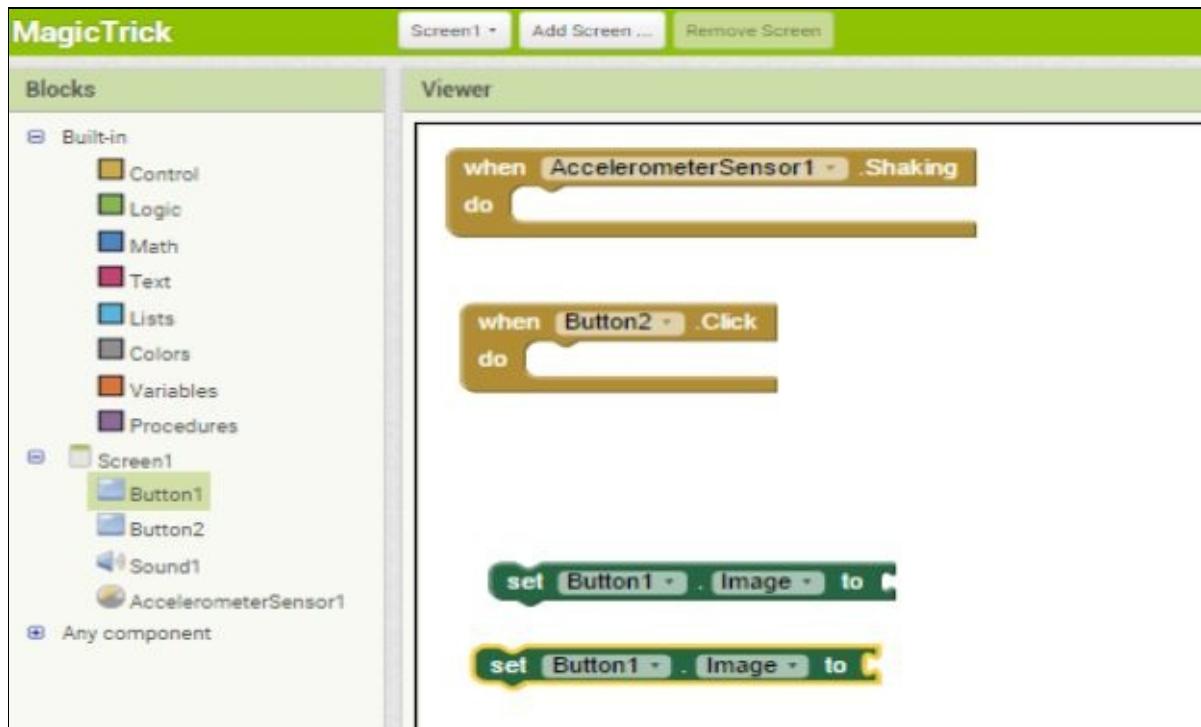

10. Now go to **Blocks** and click on **AccelerometerSensor1** and select **block**. This block will identify shaking activity of your phone and decide what to do when your phone is shaking.

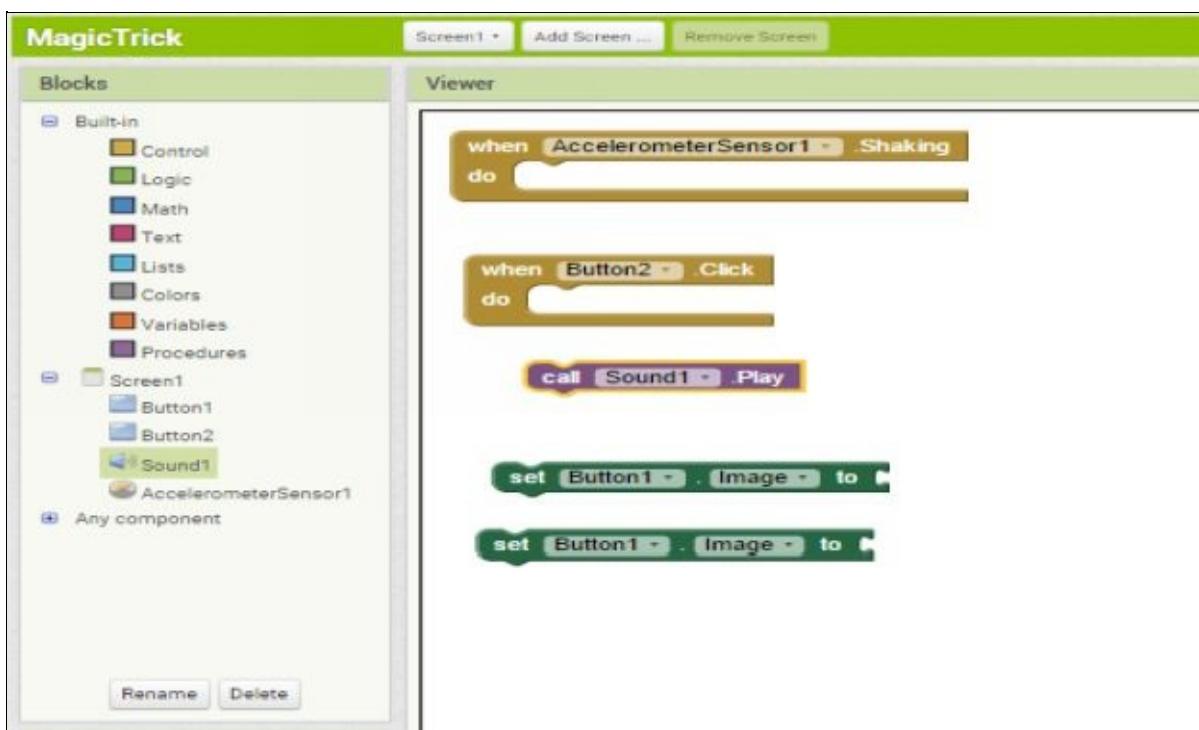

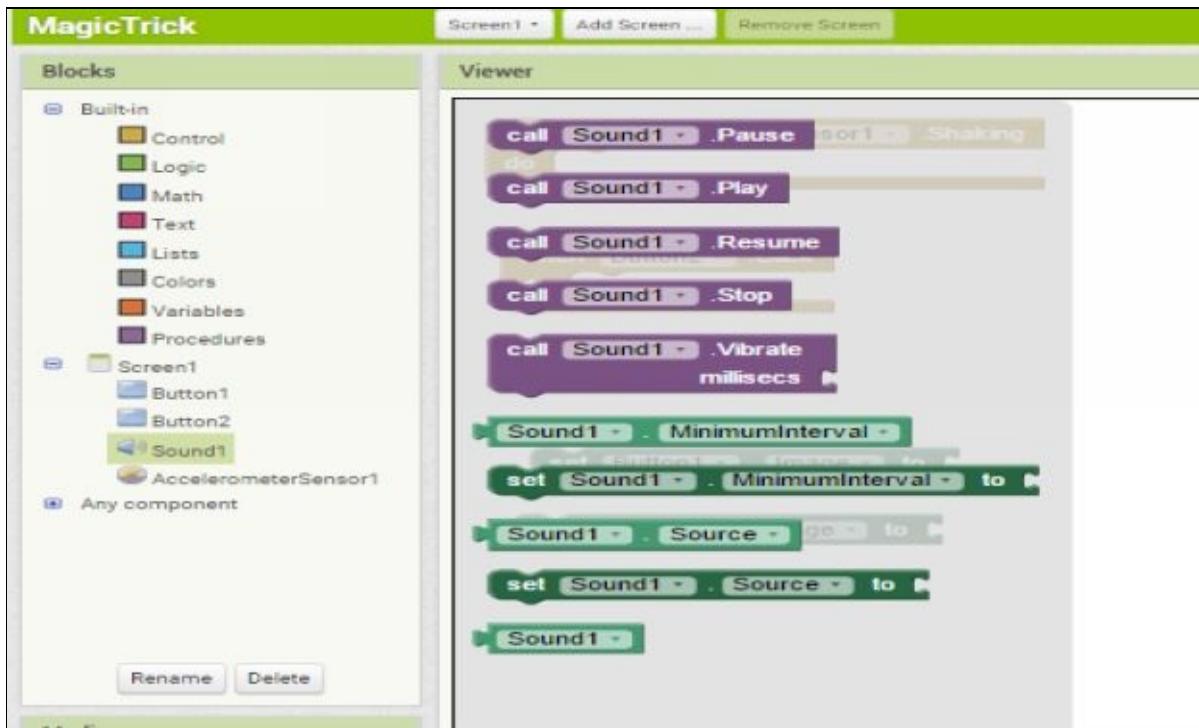

11. Now click on **Button2** and select **block**. Here Button2 is Reset button of your app.

12. Now click on **Button1** and scroll down to select **set [Button1 . Image] to [ ]** block twice.

13. Now click on **Sound1** and select **call [Sound1 . Play]** block. This block will play sound **TaDasound.mp3**.

14. Attach the **blocks** as shown below.

**MagicTrick**

Screen1 Add Screen ... Remove Screen

**Blocks**

## Chapter 17 Live FM App

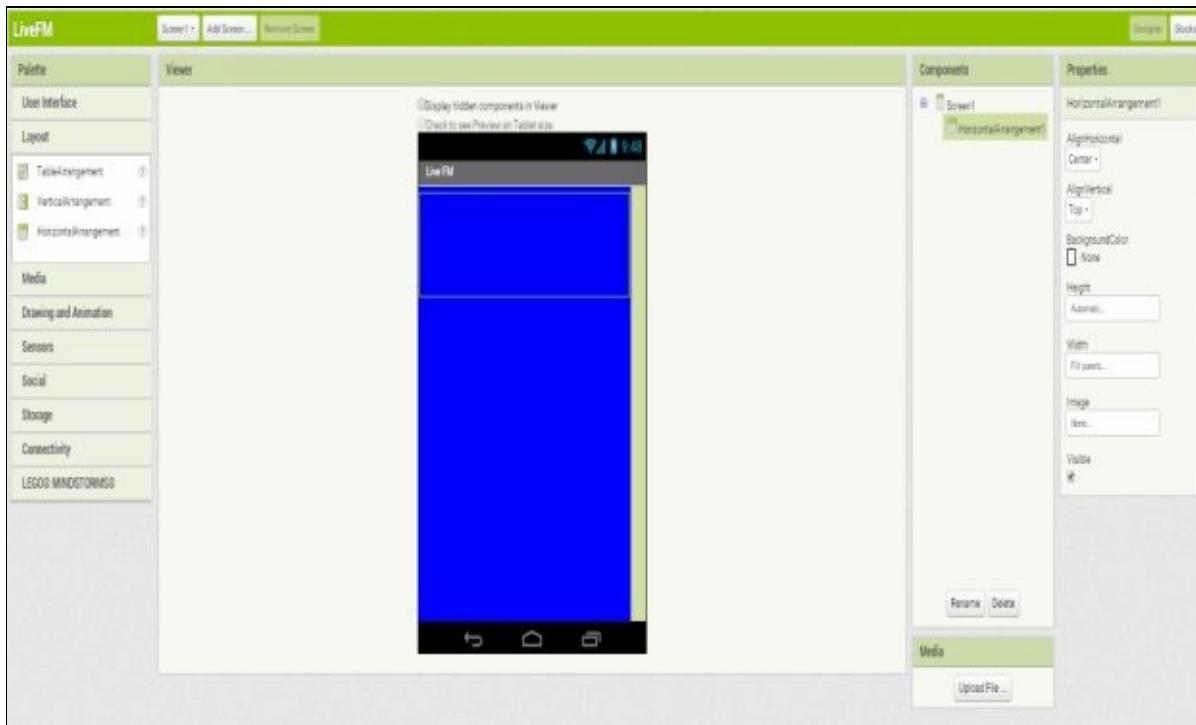

1. Click on **Start new project** and give it name **LiveFM** and Click **OK**.

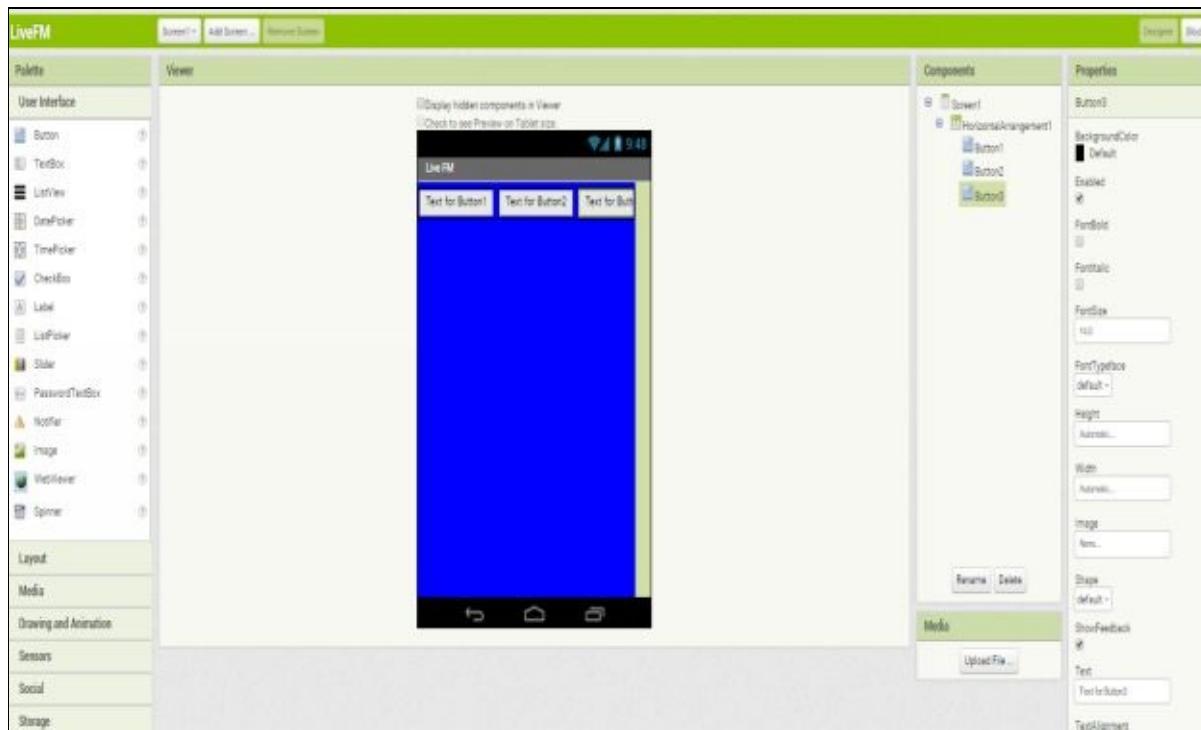

2. Change **Screen1 Title** to **Live FM** and **BackgroundColor** to **Blue**.

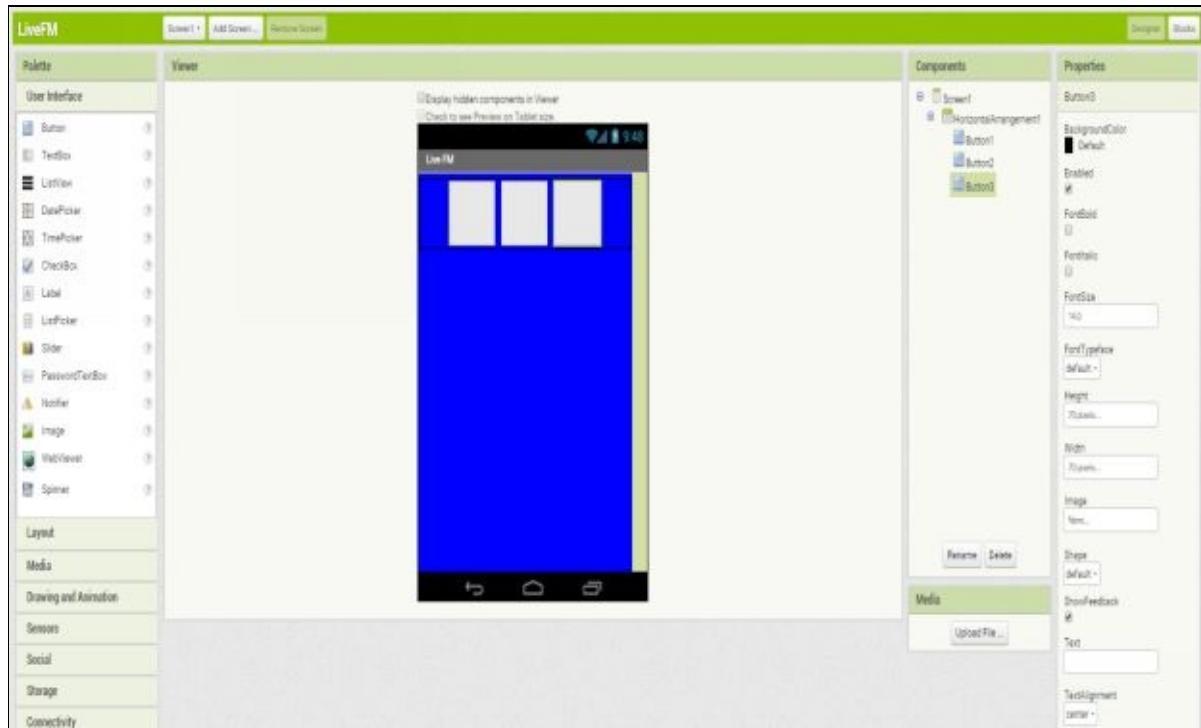

3. Drag a **HorizontalArrangement** component from **Palette** to **Viewer** screen and set its **Width** to **Fill parent** and **BackgroundColor** to **None** and Set **AlignHorizontal** to **Center**.

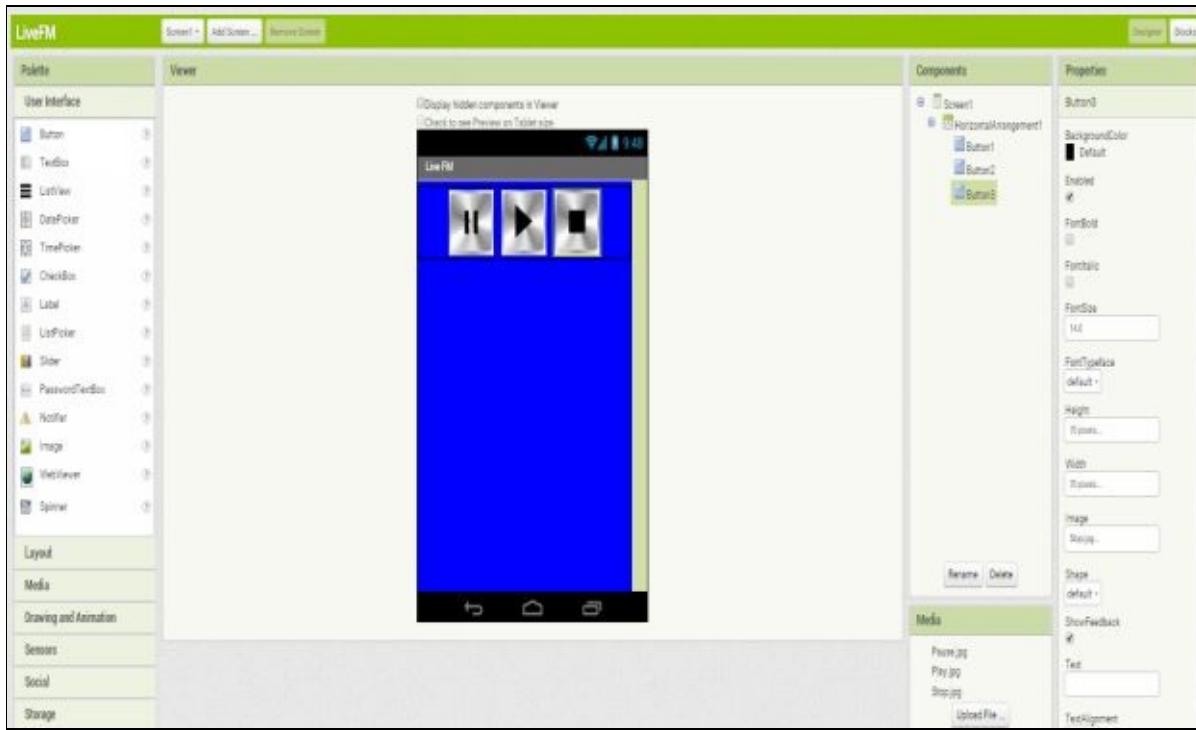

4. Drag 3 **Buttons** from **Palette** to **Viewer** screen, inside **HorizontalArrangement**.

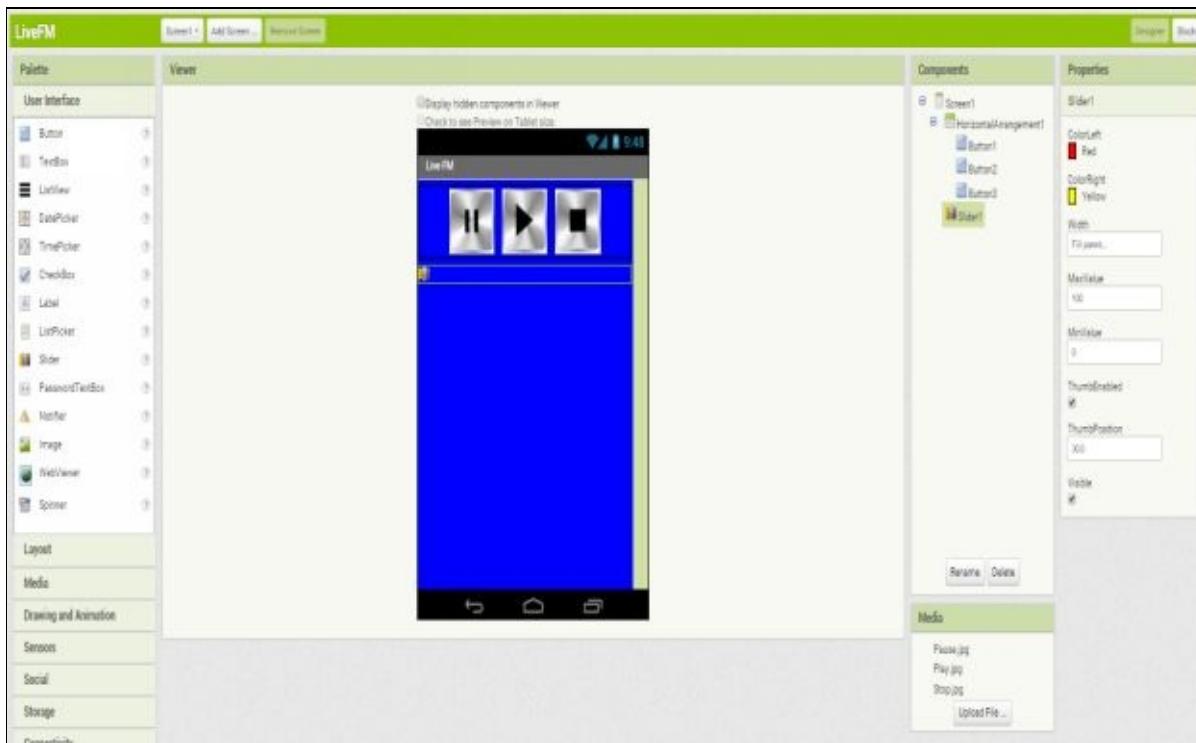

5. Delete the **Button's Text** and set their **Height** and **Width** both to **70 pixels** each.

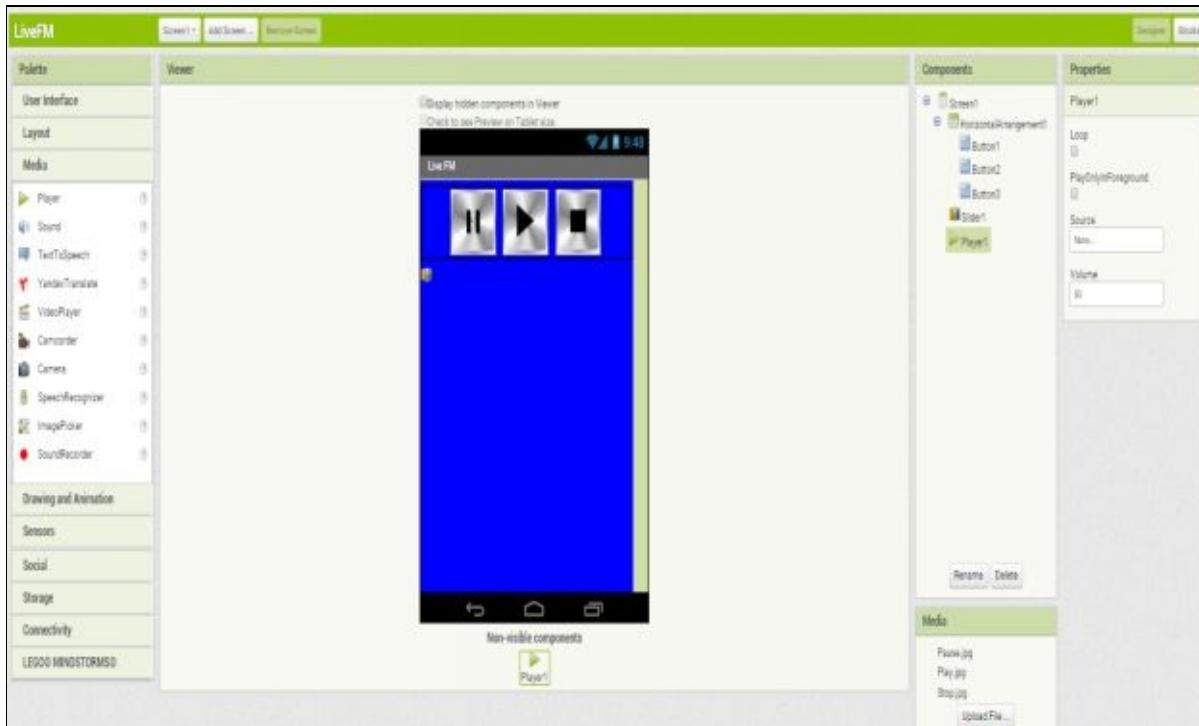

6. Set **Button's Images** as shown below.

7. Drag a **Slider** from **Palette** to **Viewer** screen and set it's **Properties** as shown below.

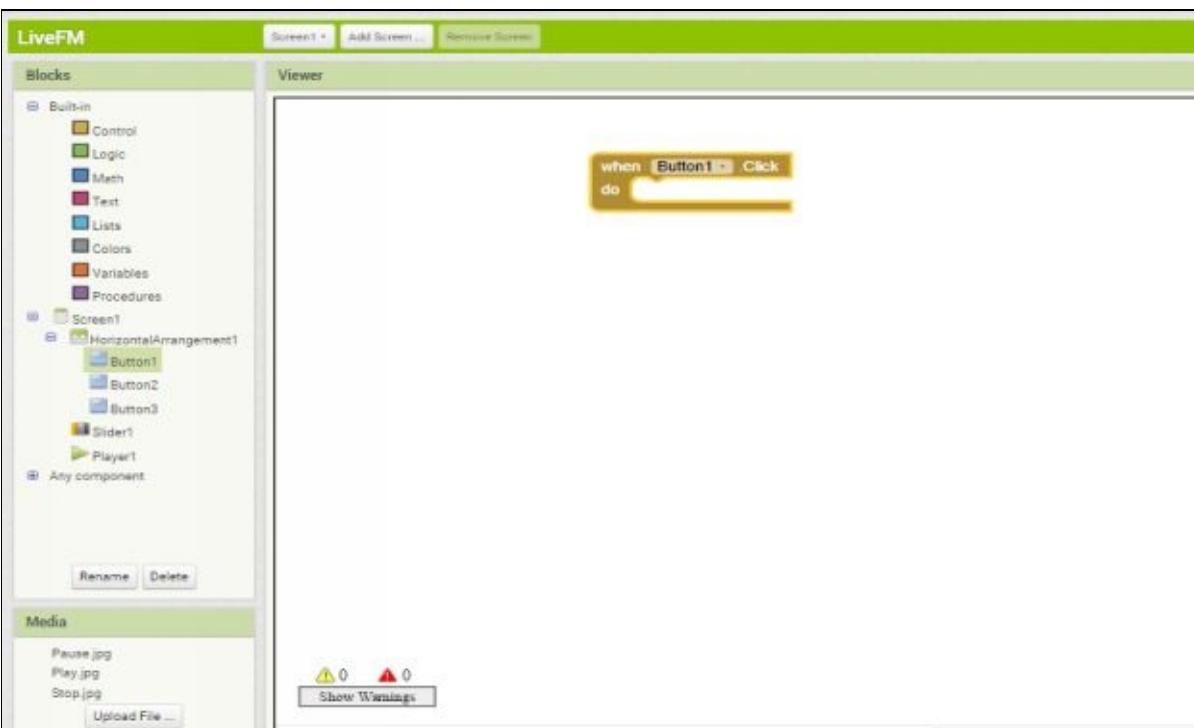

8. Drag a **Player** component from **Palette** to **Viewer**.

9. Now go to **Blocks** and Click on **Button1** component and select  block.

This is an event block which will decide what your app will do when this button will be clicked. Here click is an event for Button1 component.

```

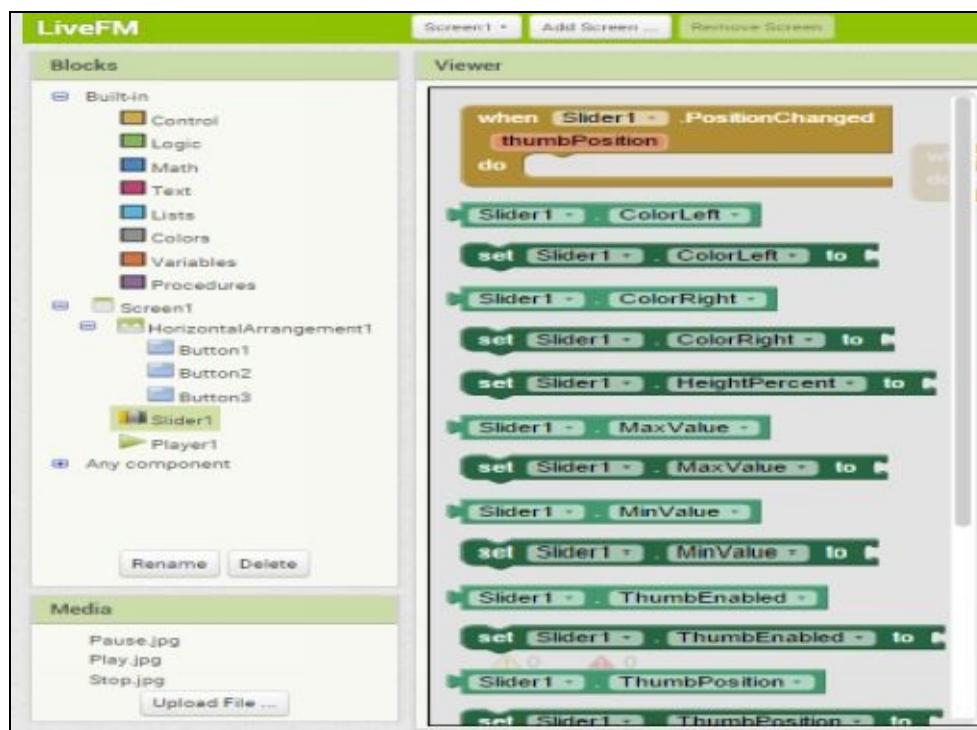

when [Button2 v].Click
do [ ]
when [Button3 v].Click
do [ ]

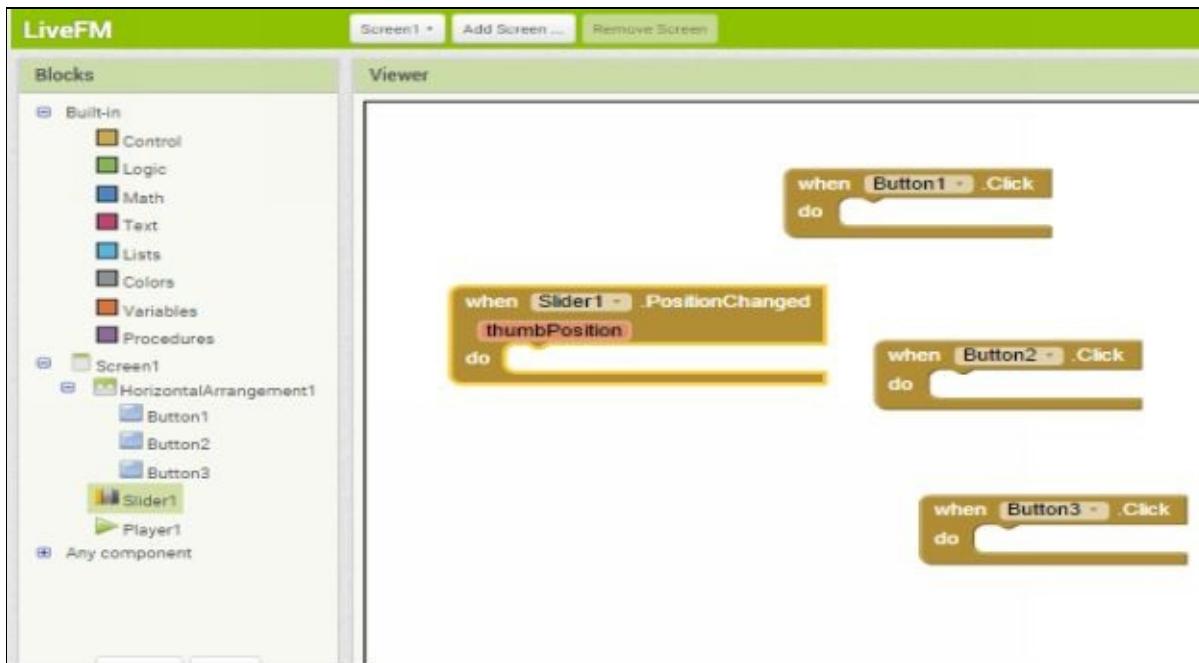

```

10. As shown in step 10 select **blocks** by clicking on **Button2** and **Button3**.

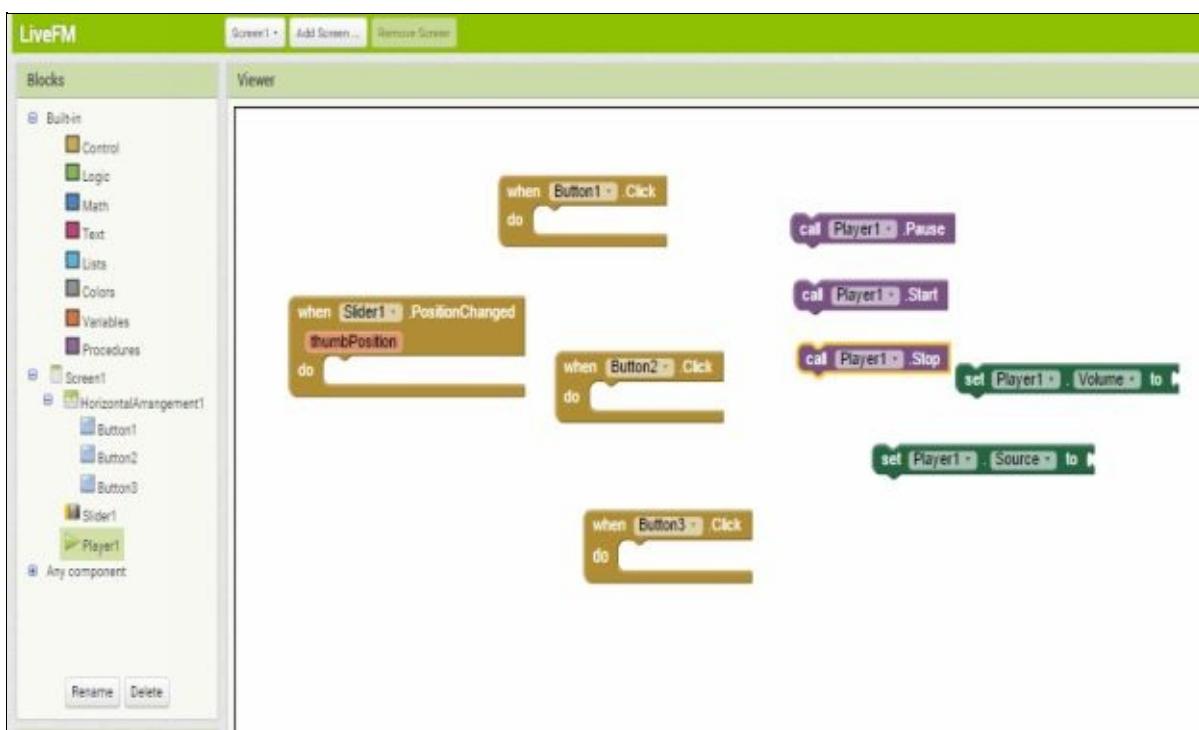

11. Now click on **Slider1** and select **block**.

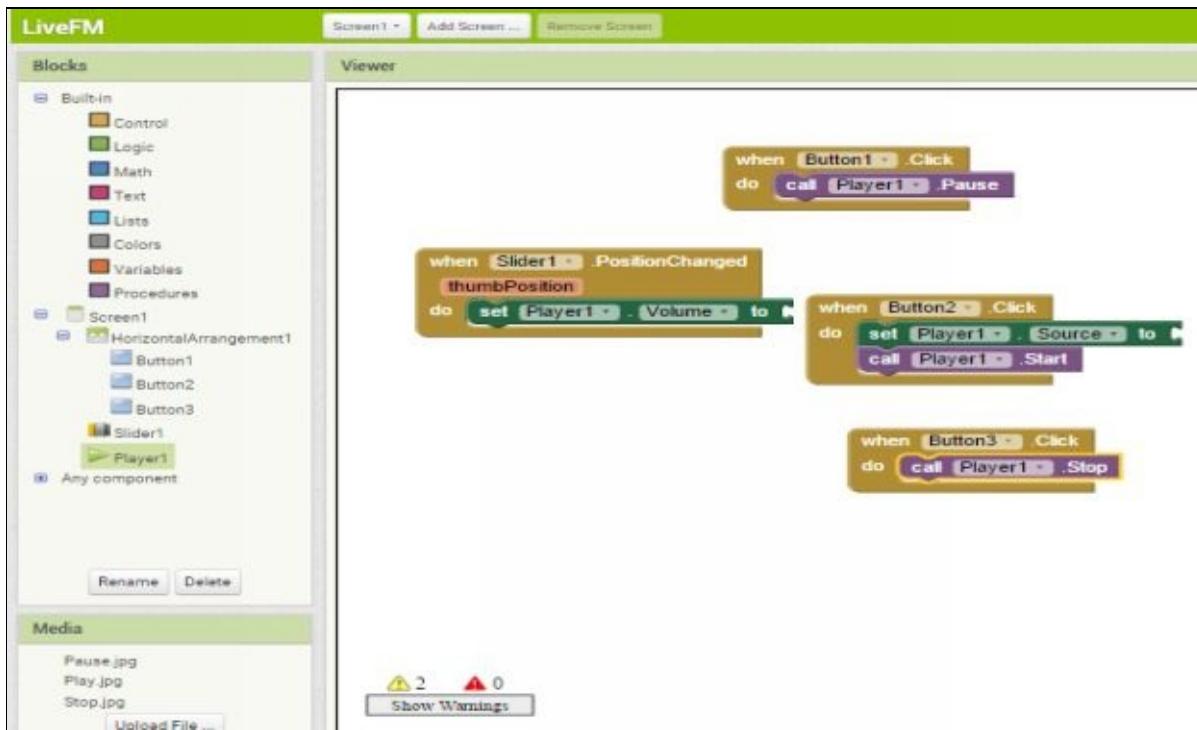

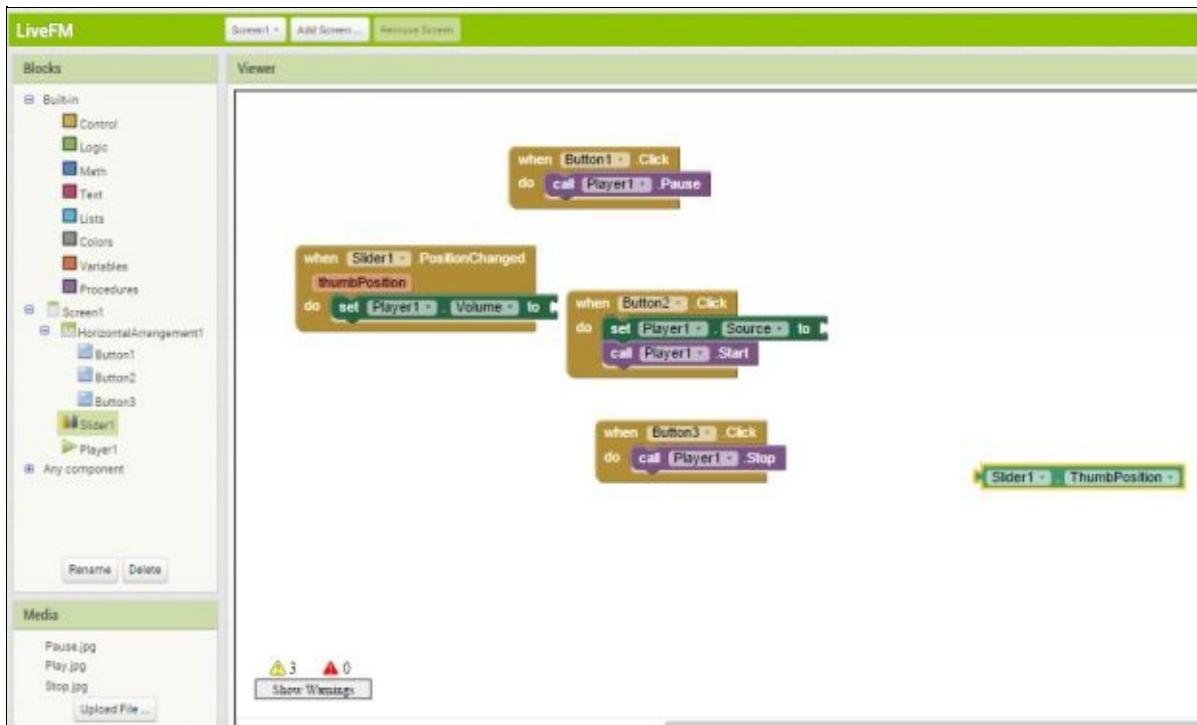

12. Click on **Player1** and select below shown **blocks**.

13. Attach the **blocks** as shown below.

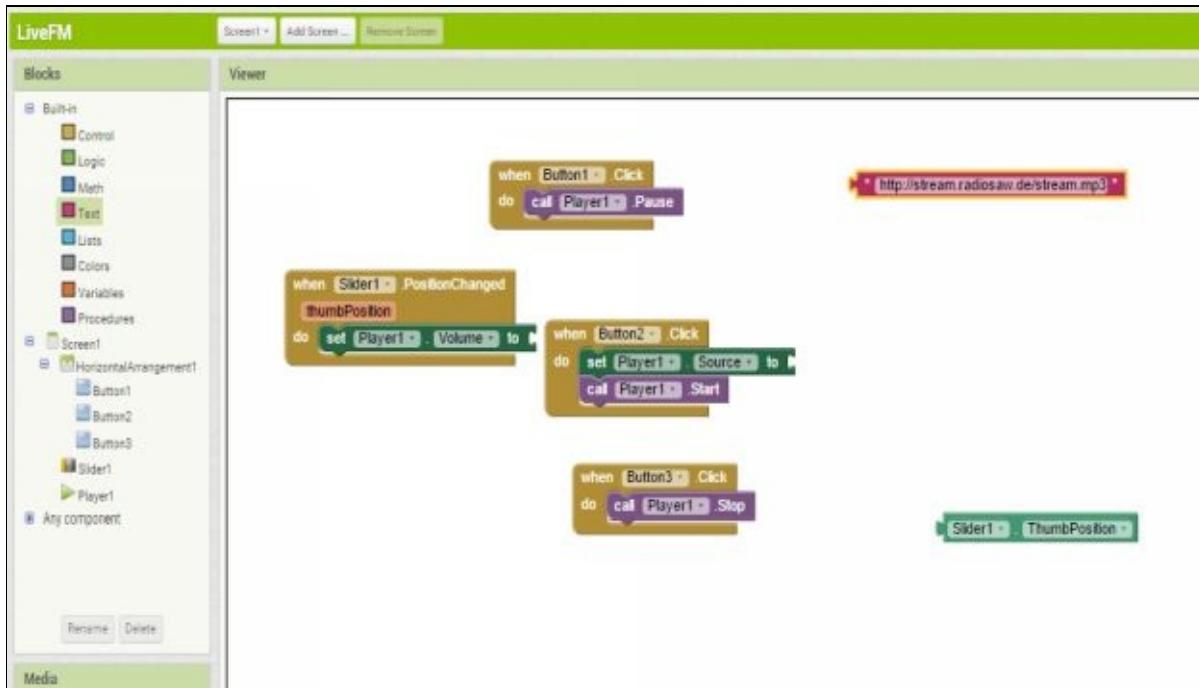

14. Click on **Slider1** and select **Slider1 .ThumbPosition** block. This block will represent a value depending on your ThumbPosition on slider.

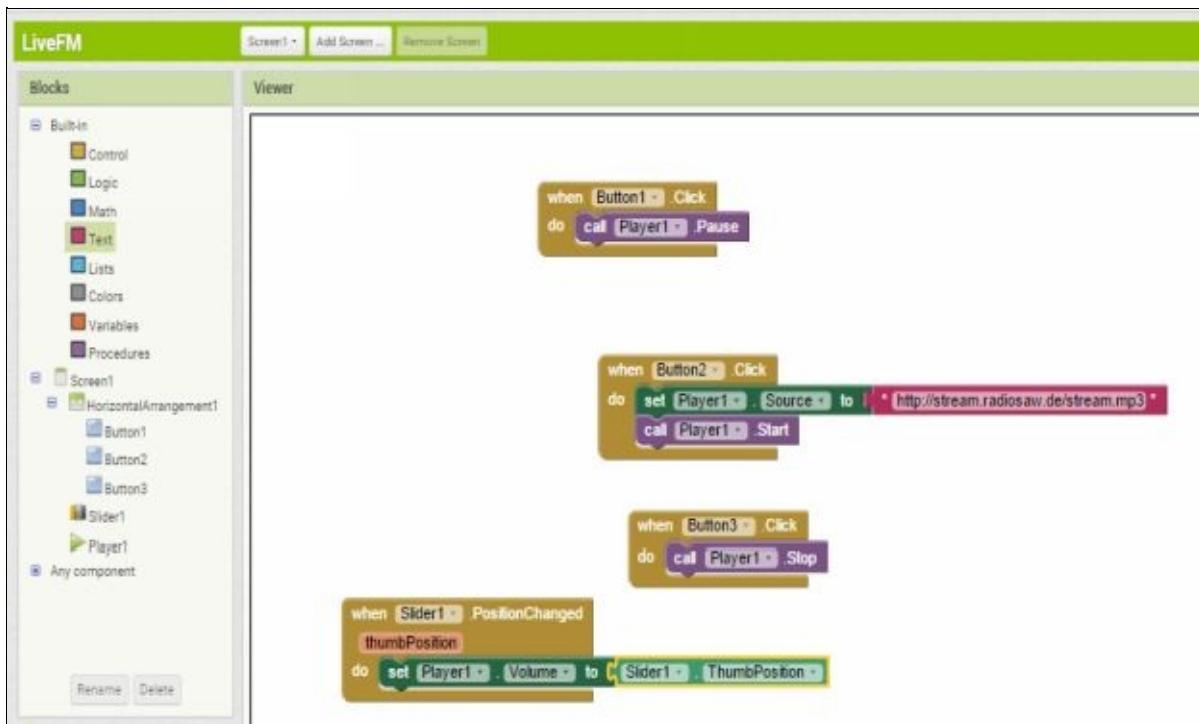

15. Click on **Text** under **Built-in** and select **HTTP** block and type <http://stream.radiosaw.de/stream.mp3> inside the block.

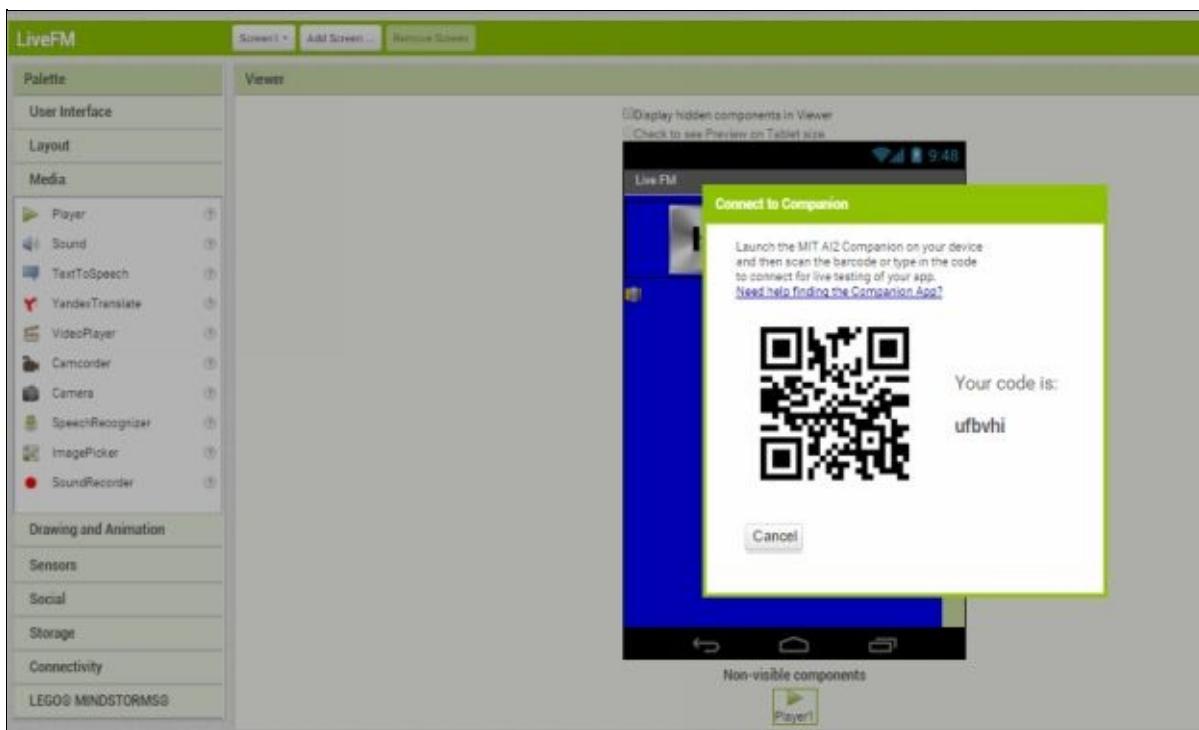

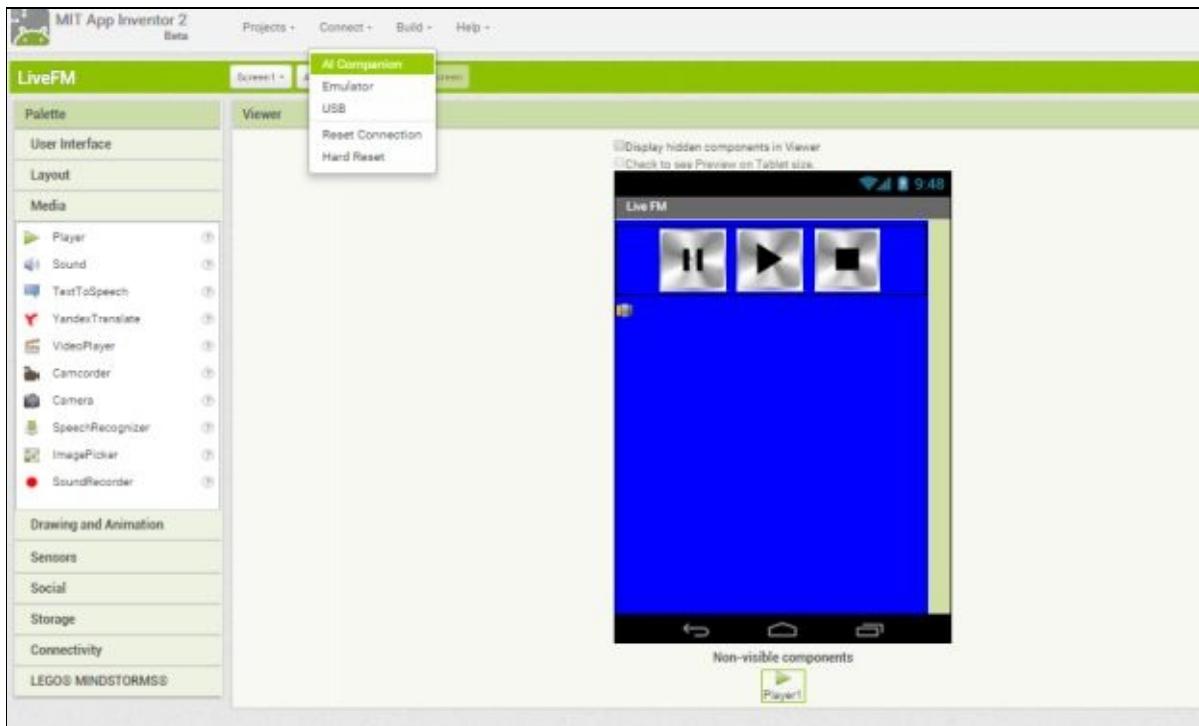

16. Attach the **blocks** as shown below.

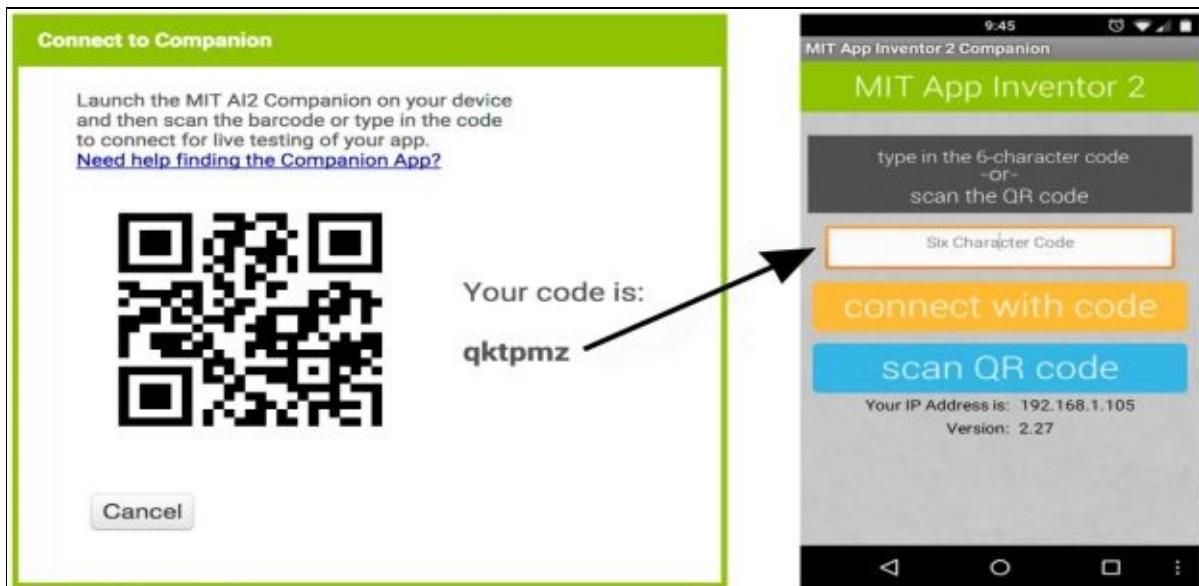

17. Go to **Designer** and click on **Connect** then select **AI Companion**.

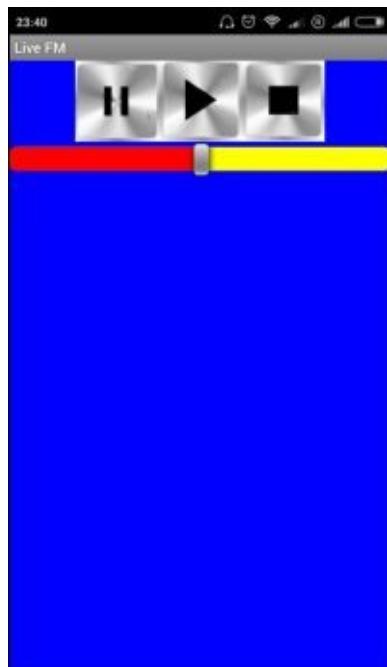

18. Now open [MIT App Inventor 2 Companion](#) in your mobile/Tablet.

And enter the code or scan the [QR code](#) from your mobile and click on connect with code.

Note:-Your Mobile/Tablet should be connected to same wi-fi/network to which your computer/Laptop is connected.

19. Now you should see your app in your phone for live testing. Click on **Play Button** to listen to FM. Try other buttons also. You can **adjust Volume** by adjusting the slider.

## Chapter 18 Bounce Ball App

1. Click on **Start new project** and give it name **Bouncing\_Ball** and Click **OK**.

The screenshot shows the 'My Projects' section of the App Inventor interface. On the left, there's a list of projects with their names and creation dates. A modal dialog box titled 'Create new App Inventor project' is open in the center, prompting for a project name 'Bouncing\_Ball'. The background table has columns for 'Date Created' and 'Date Modified'.

## 2. Change Screen1 Title to Bounce Ball.

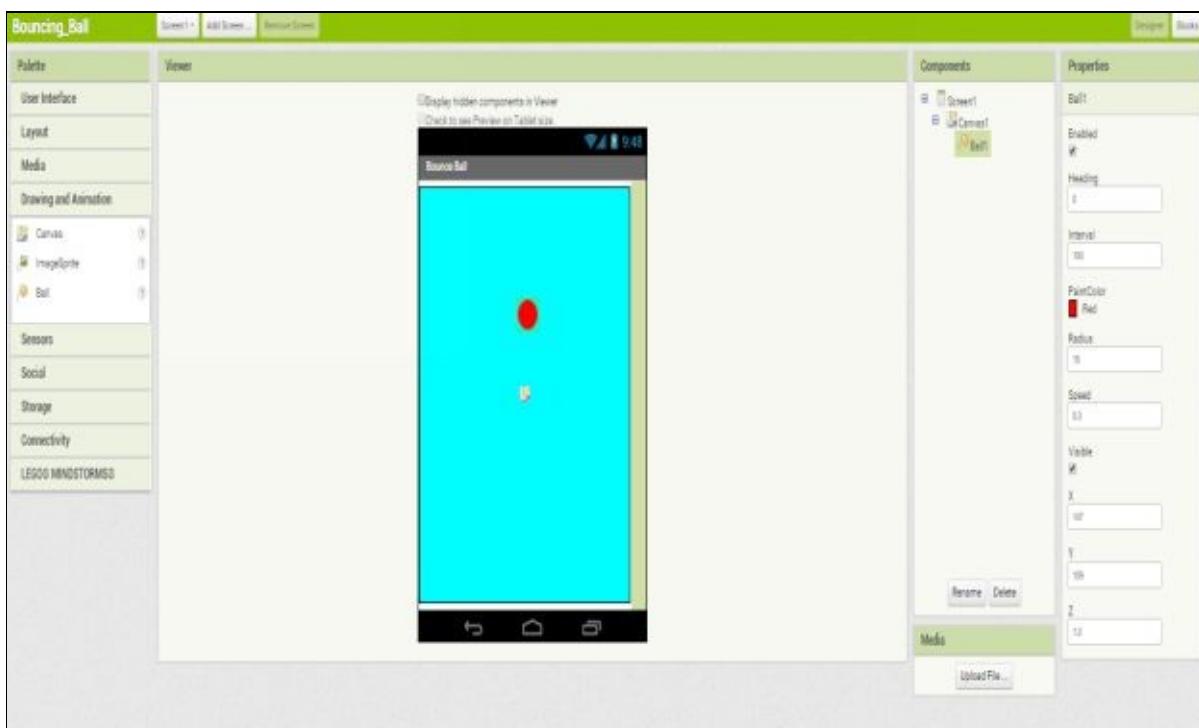

The screenshot shows the 'Designer' tab of the App Inventor workspace for the 'Bouncing\_Ball' project. The 'Components' panel on the right shows a new component named 'Screen1' with its properties being set. The 'Properties' panel shows the 'Title' property set to 'Bounce Ball'. The 'Viewer' panel displays a preview of the screen with the title bar labeled 'Bounce Ball'.

## 3. Drag a Canvas from Palette to Viewer screen and set it's Height and Width to Fill parent.

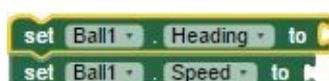

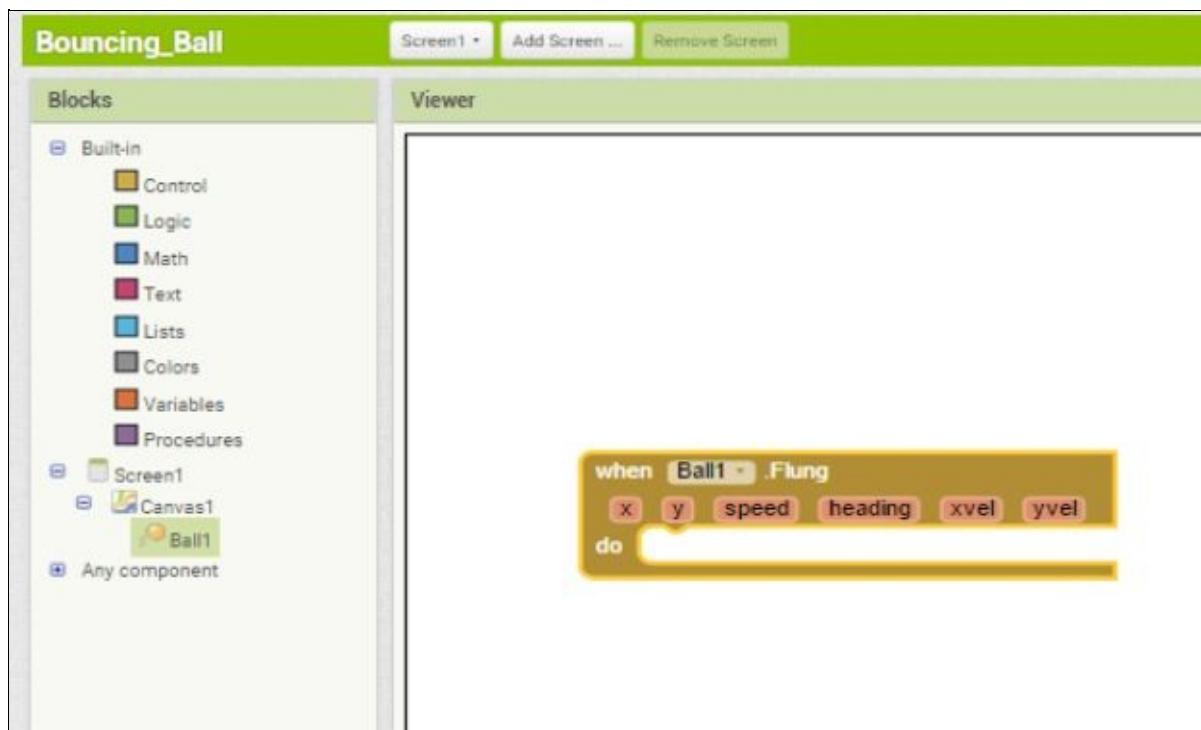

Change Canvas1's BackgroundColor to Cyan.

4. Drag a **Ball** from **Palette** to **Viewer Screen** and set it's **Radius** to **15** and **PaintColor** to **Red**.

5. Go to **Blocks** and click on **Ball1** and select block. This block will identify flung activity on your screen.

6. Click on **Ball1** and select **blocks**. These block will set ball's moving speed and direction.

10. Go to Designer and click on Connect then select AI Companion.

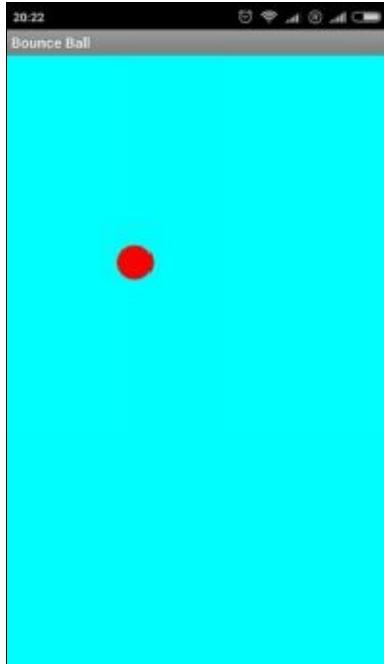

11. Now open MIT App Inventor 2 Companion in your mobile/Tablet. And enter the code or scan the QR code from your mobile and click on connect with code.

Note:- Your Mobile/Tablet should be connected to same wi-fi/network to which your computer/Laptop is connected.

12. Now you should see your app in your phone for live testing. Touch the ball and drag it to some direction. Ball will start moving to that direction and will bounce when reached an edge.

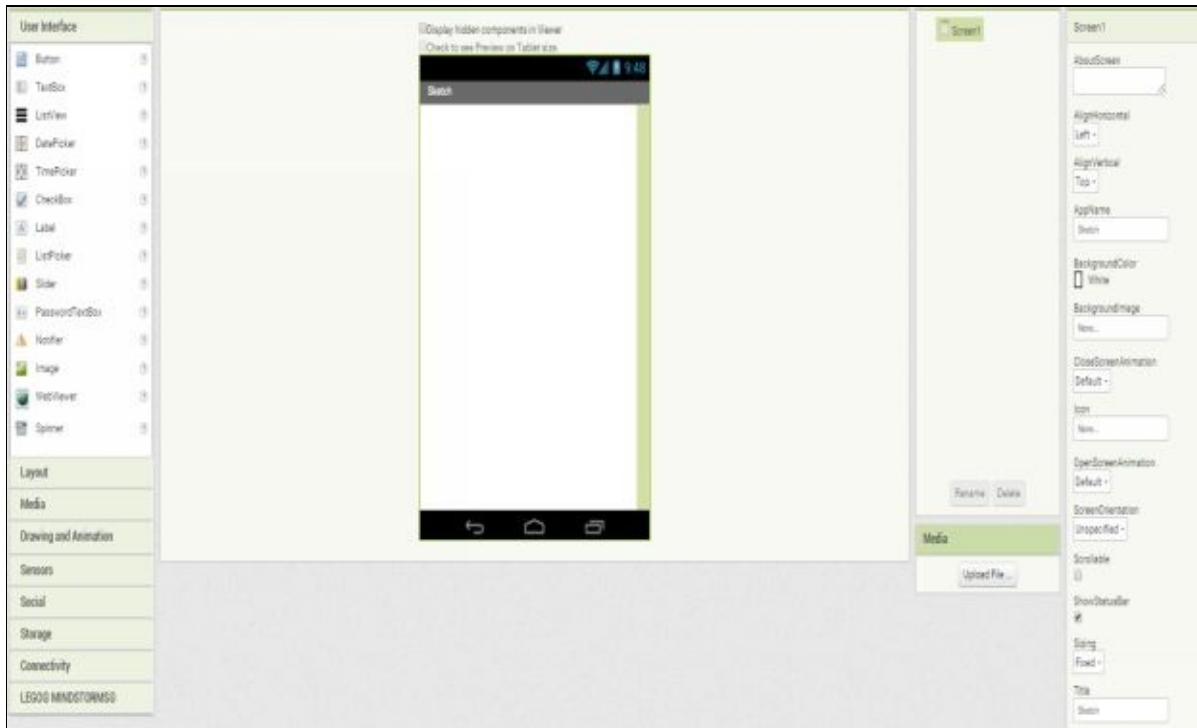

## Chapter 19 Sketch-A drawing app

1. Click on **Start new project** and give it name **Sketch** and Click **OK**.

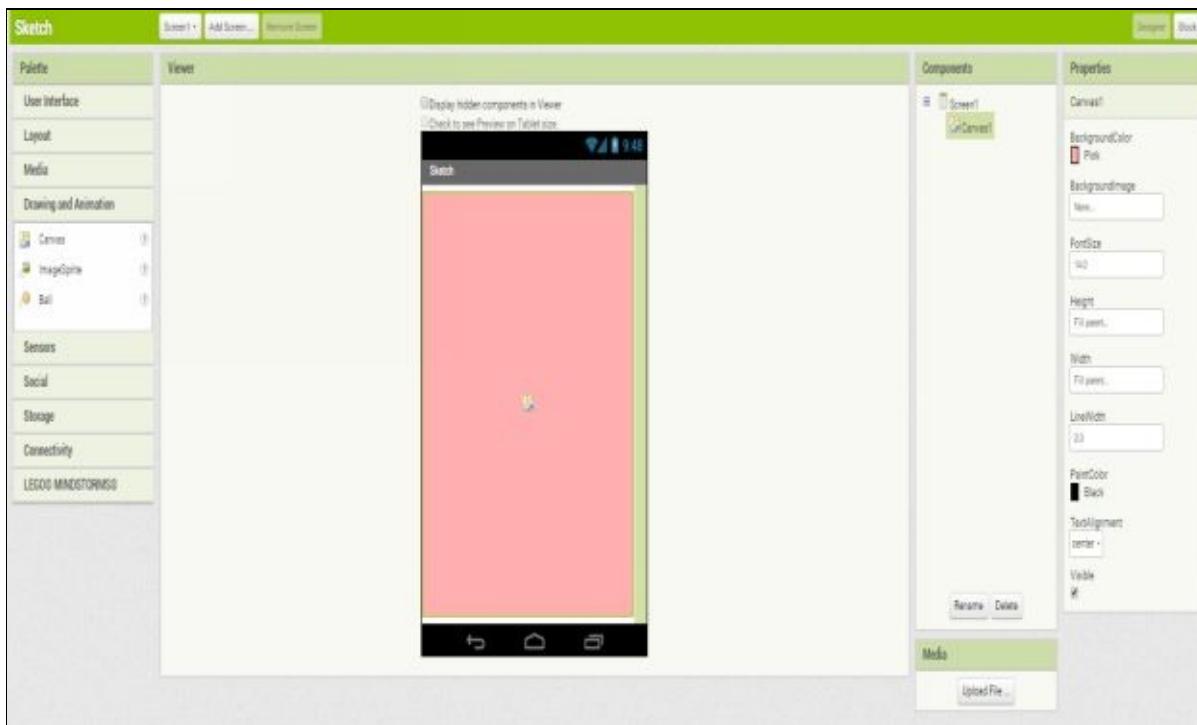

The screenshot shows the App Inventor Project Manager interface. At the top, there are three buttons: 'Start new project' (highlighted in green), 'Delete Project', and 'Publish to Gallery'. Below this is a section titled 'My Projects' with a table listing various projects. The columns are 'Name', 'Date Created', and 'Date Modified'. A new project dialog box is overlaid on the right side of the screen, titled 'Create new App Inventor project'. It contains a 'Project name:' field with 'Sketch' typed into it, and two buttons at the bottom: 'Cancel' and 'OK'.

2. Change **Screen1 Title** to **Sketch**.

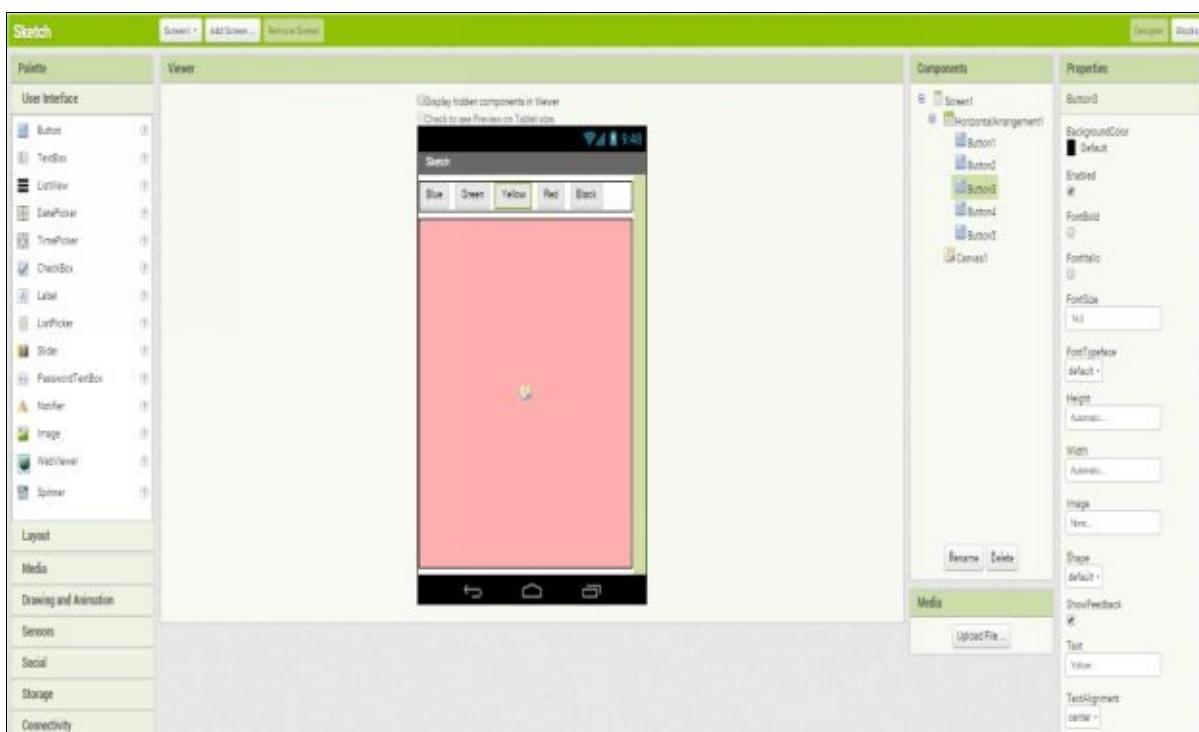

3. Drag a **Canvas** from Palette to **Viewer** screen and set it's **Height** and **Width** to Fill parent and change its **BackgroundColor** to **Pink**.

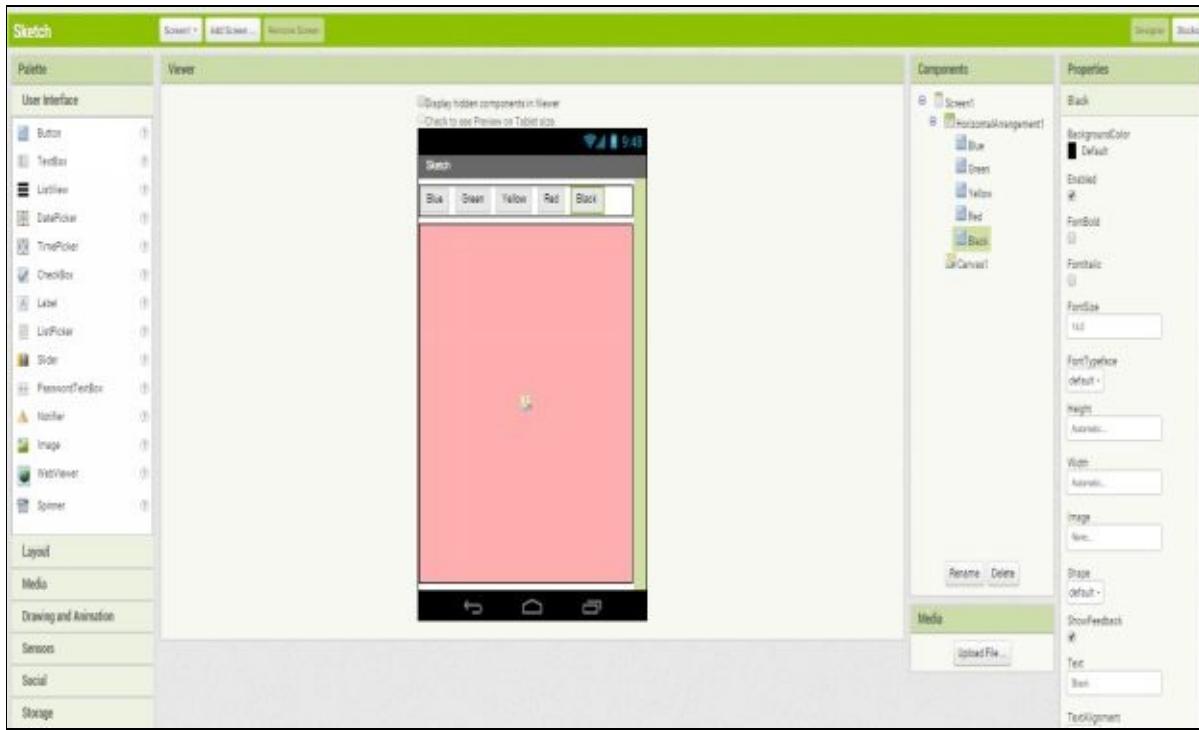

4. Drag a **HorizontalArrangement** component from Palette to **Viewer** and set it's **Width** to **Fill parent** and change **BackgroundColor** to **None**.

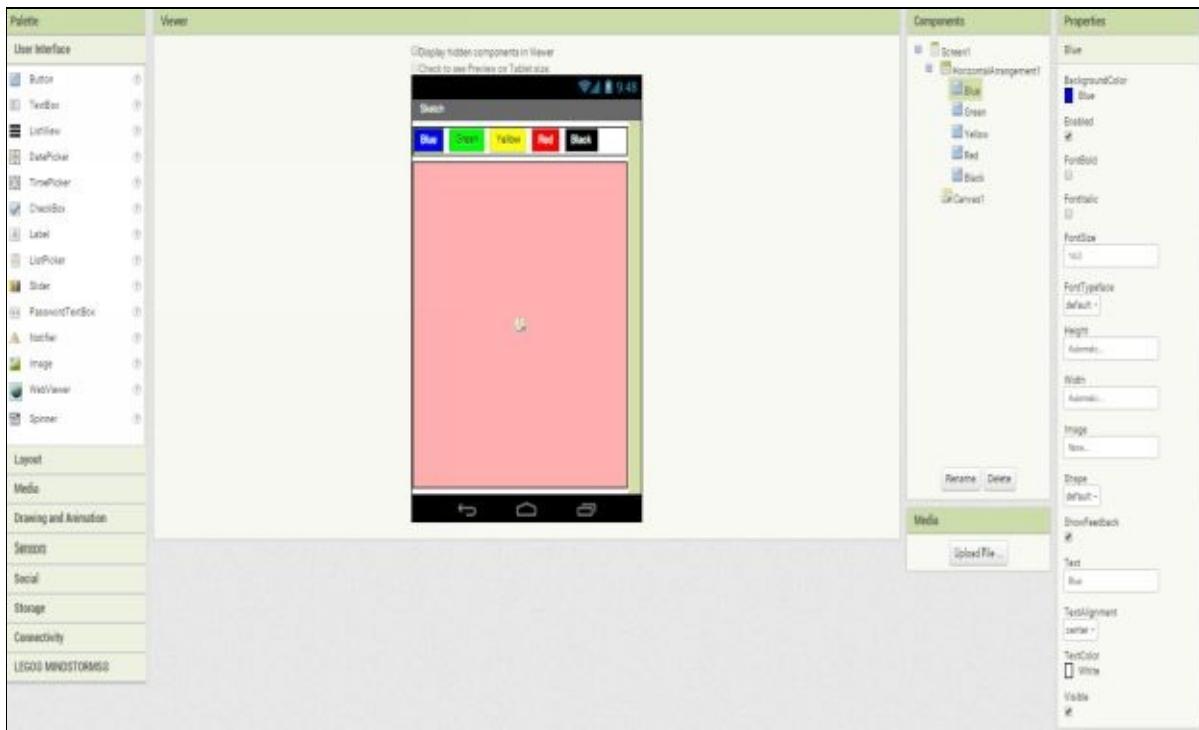

5. Now drag 5 Buttons from **Palette** to **Viewer** and change it's Text as shown below.

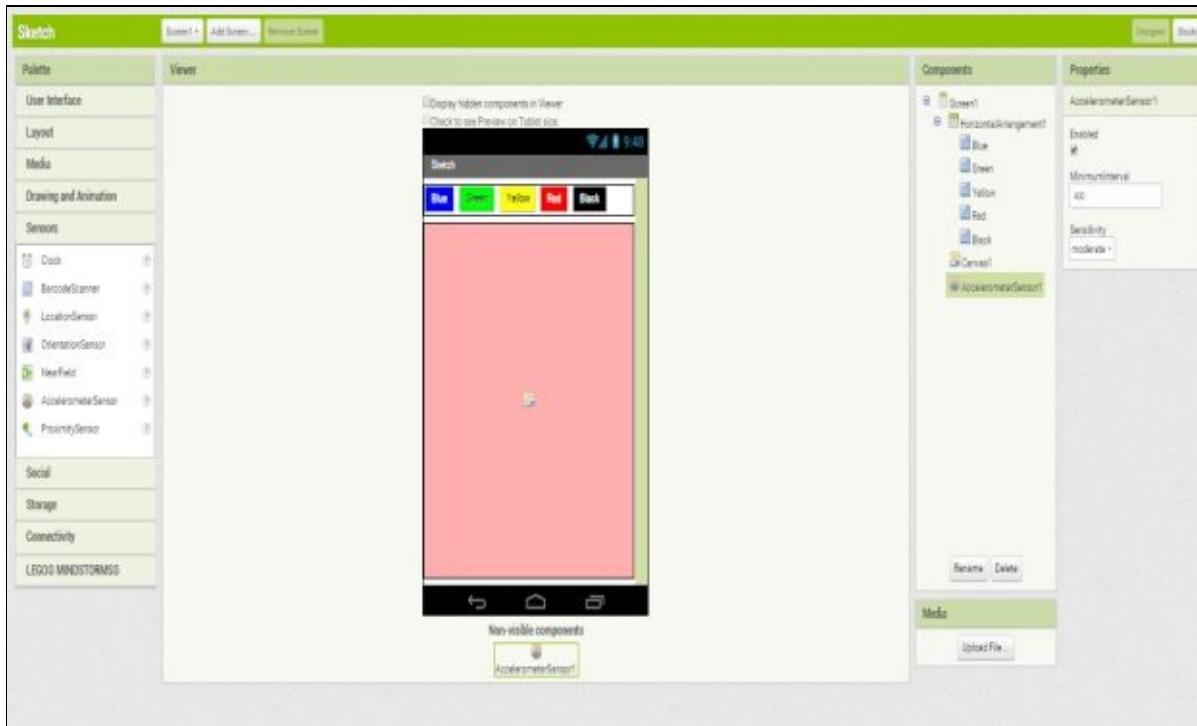

6. Change **Button Names** as well.

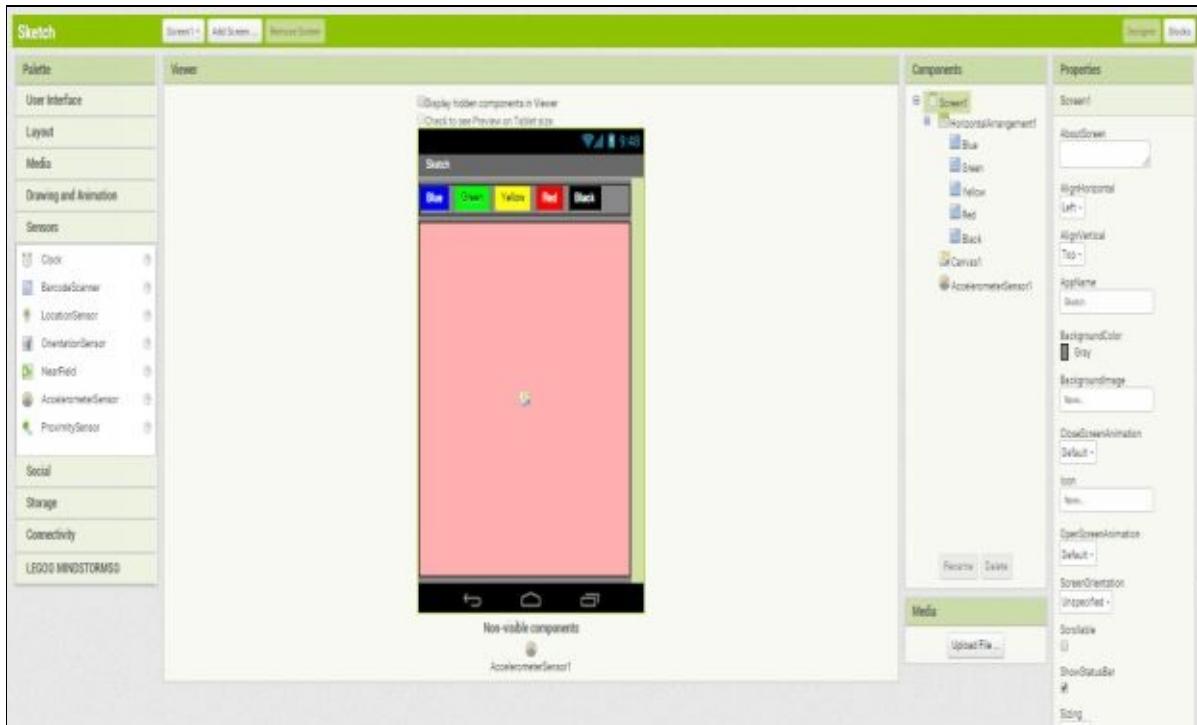

## 7. Change Button BackgroundColors and TextColors.

## 8. Drag an Accelerometer (Non-visible) component from Palette to Viewer.

## 9. Change Screen1 BackgroundColor to Gray.

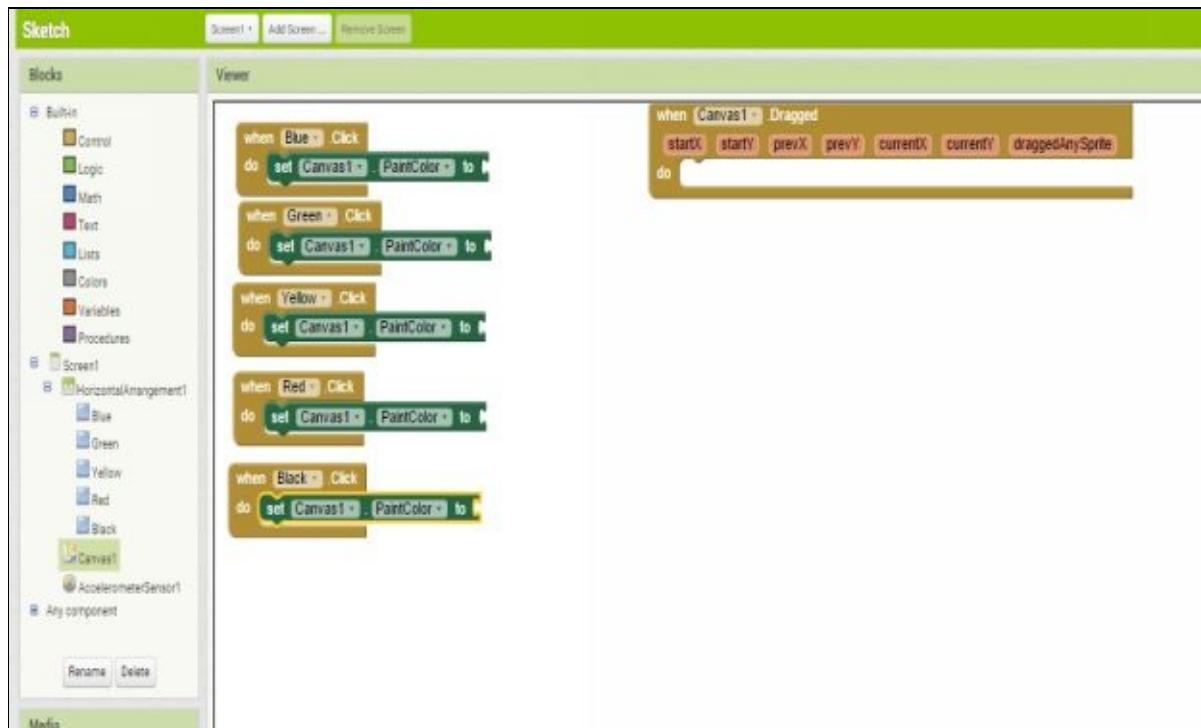

10. Go to **Blocks** and select **blocks** as shown below. These blocks will decide what to do when clicked on each of the button.

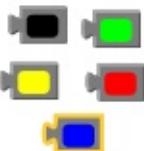

11. Now click on **Canvas1** and select these two **blocks**. This block will identify dragging activity on your canvas and decide what to do when dragged.

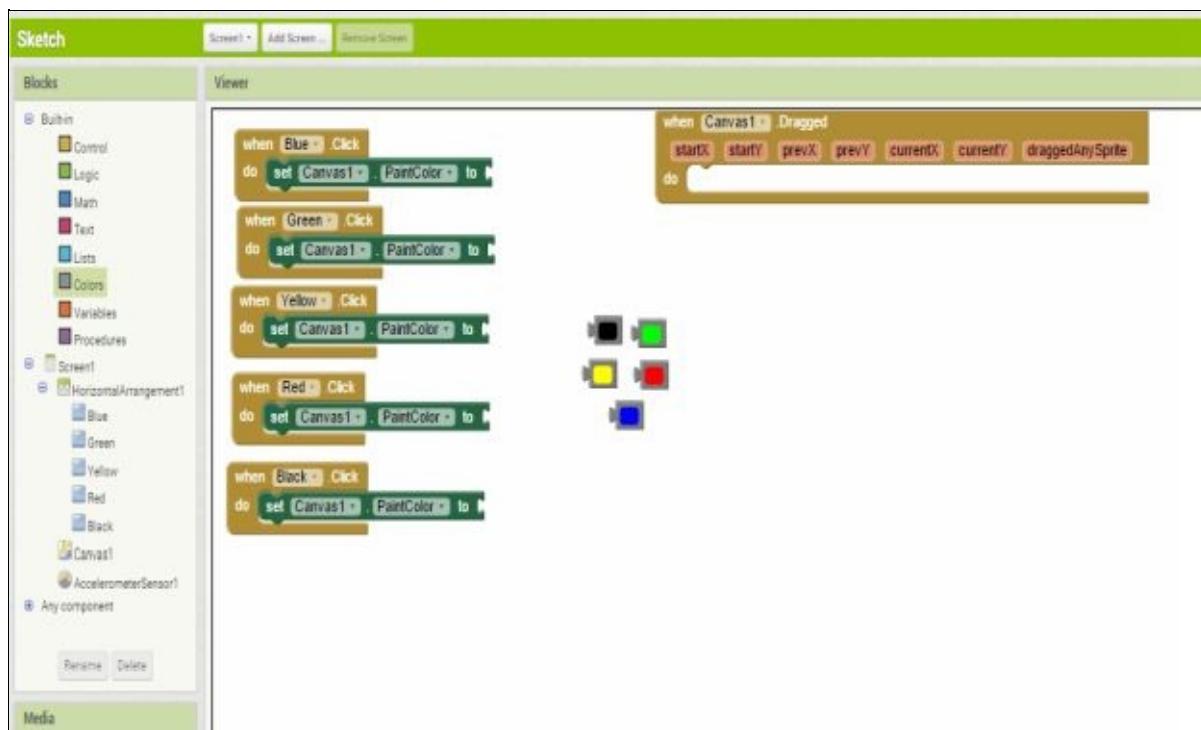

12. Now copy and paste  block 5 times and connect the blocks as shown below. This block will change the PaintColor of the Canvas when clicked on each of the button.

13. Now click on **Colors** and select these **color blocks**.

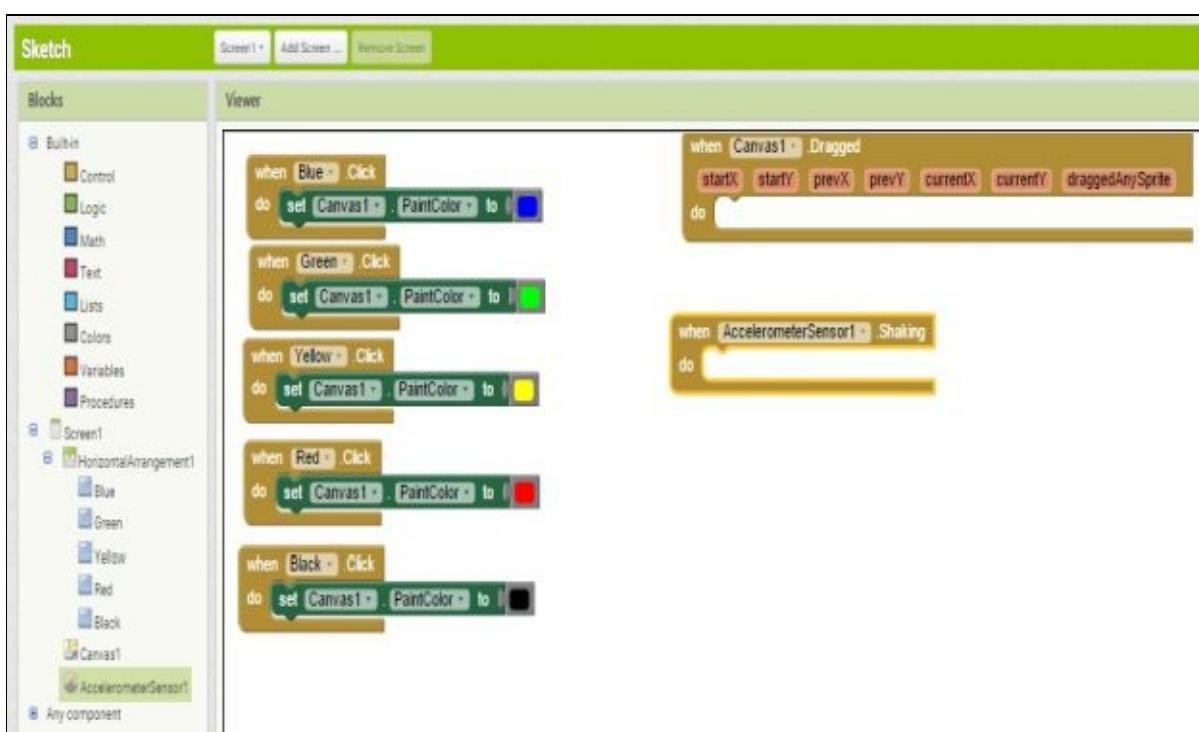

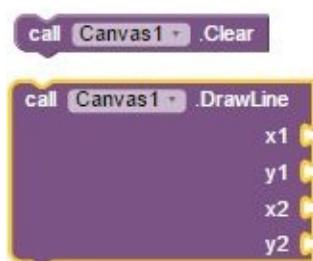

14. Attach the **blocks** as shown below. So when you click on Blue Button,PaintColor will be changed to Blue and similarly PaintColor will be change when you click on the other buttons.

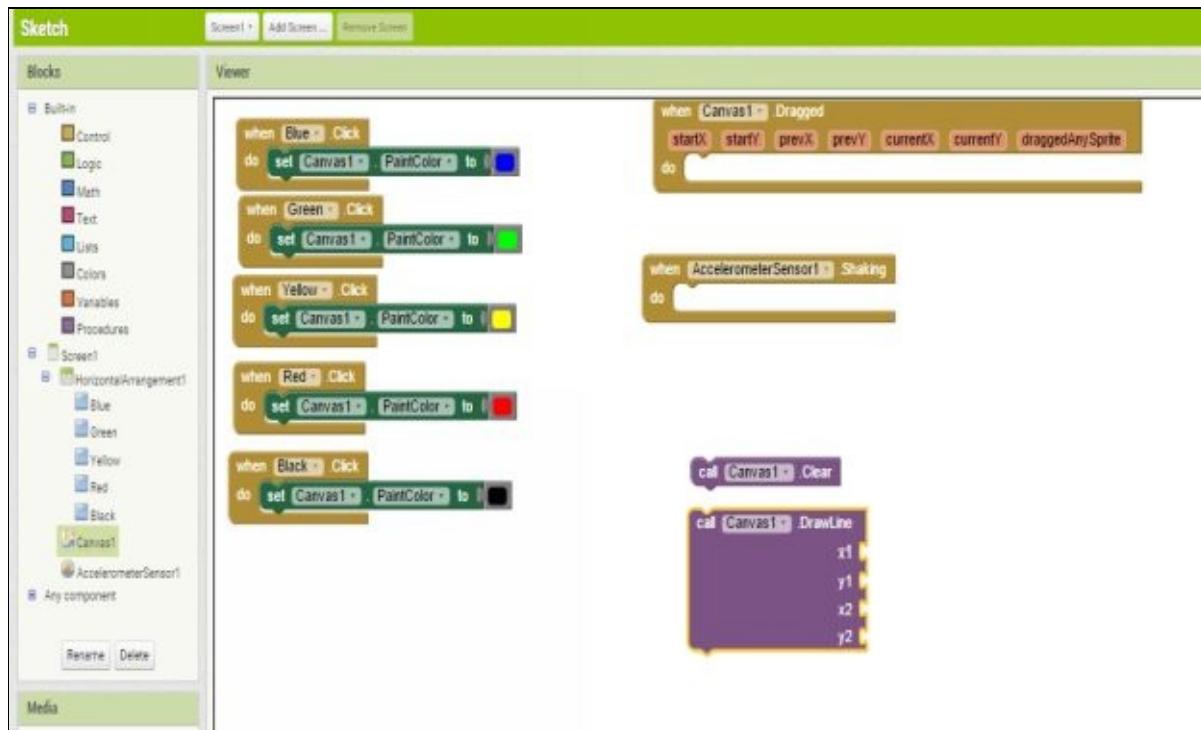

15. Click on AccelerometerSensor1 and select block.

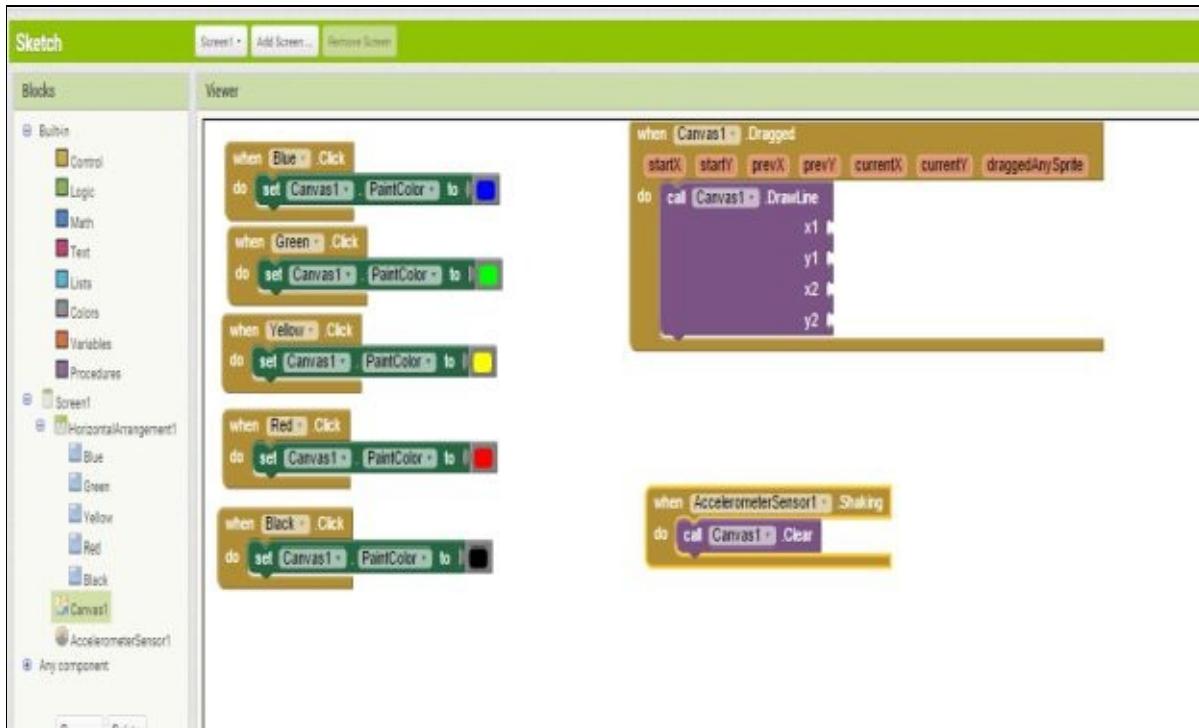

16. Now click on Canvas1 and select these two blocks.

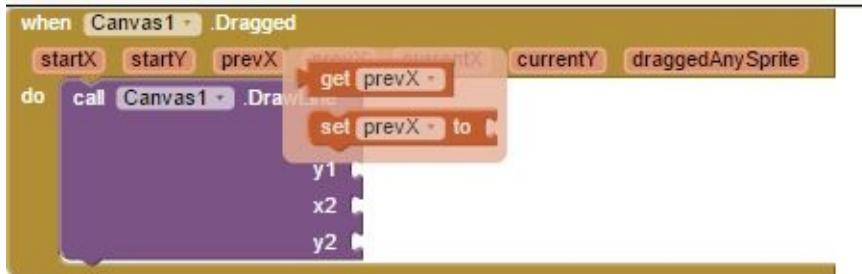

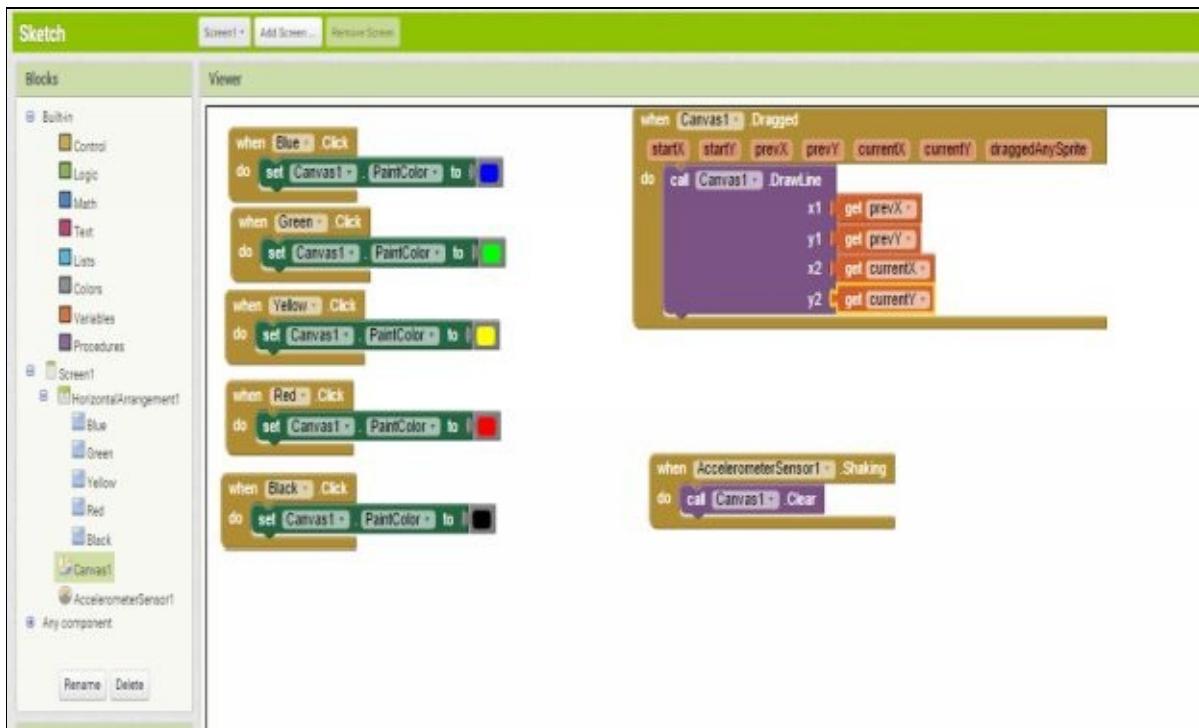

17. Attach the **blocks** as shown below. So that when you shake your phone app will clear your canvas.

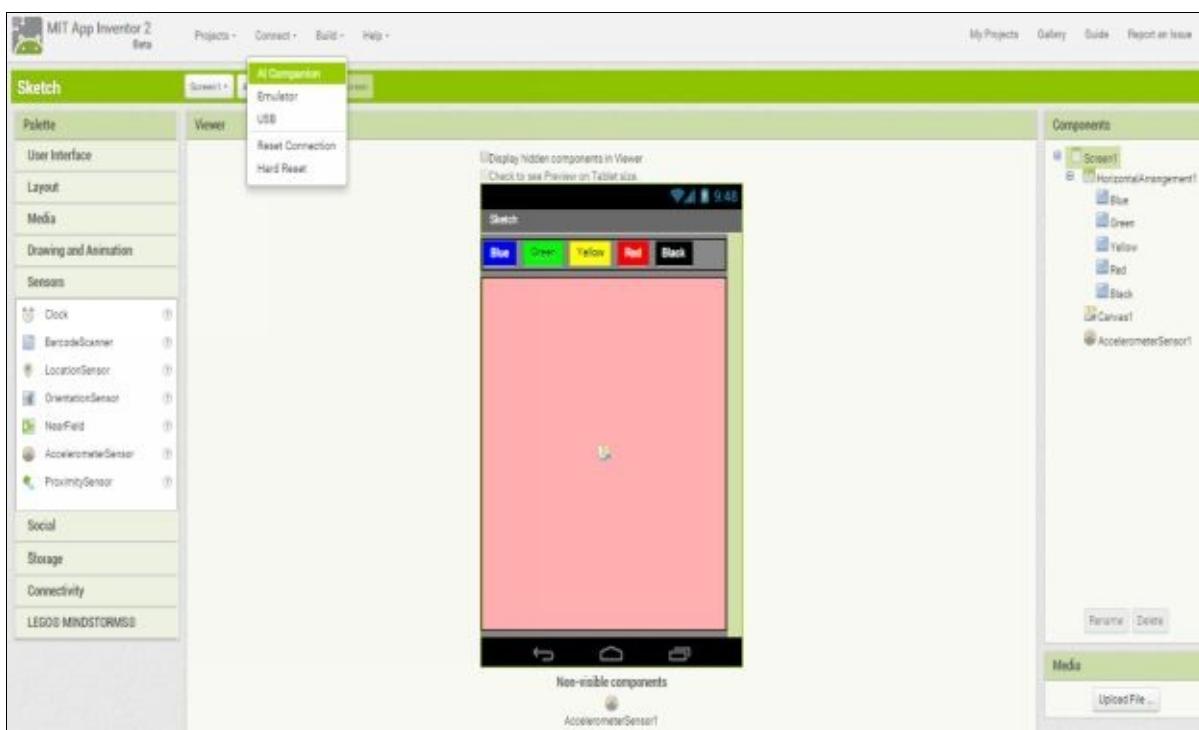

18. Now Mouse over on **prevX**, **prevY**, **currentX** and **currentY** to get these **blocks**

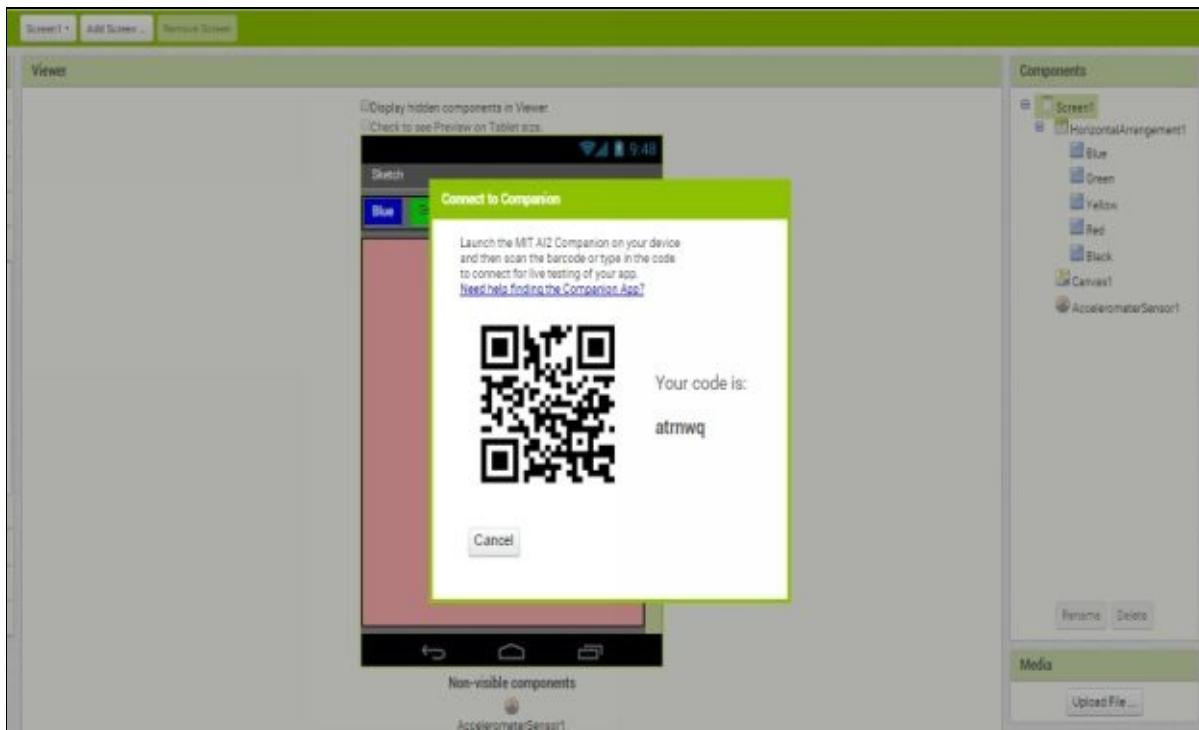

respectively and connect the **blocks** as shown below. These will represent start and end point of anything you draw on canvas.

19. Now go to Designer and click on Connect and then select AI Companion.

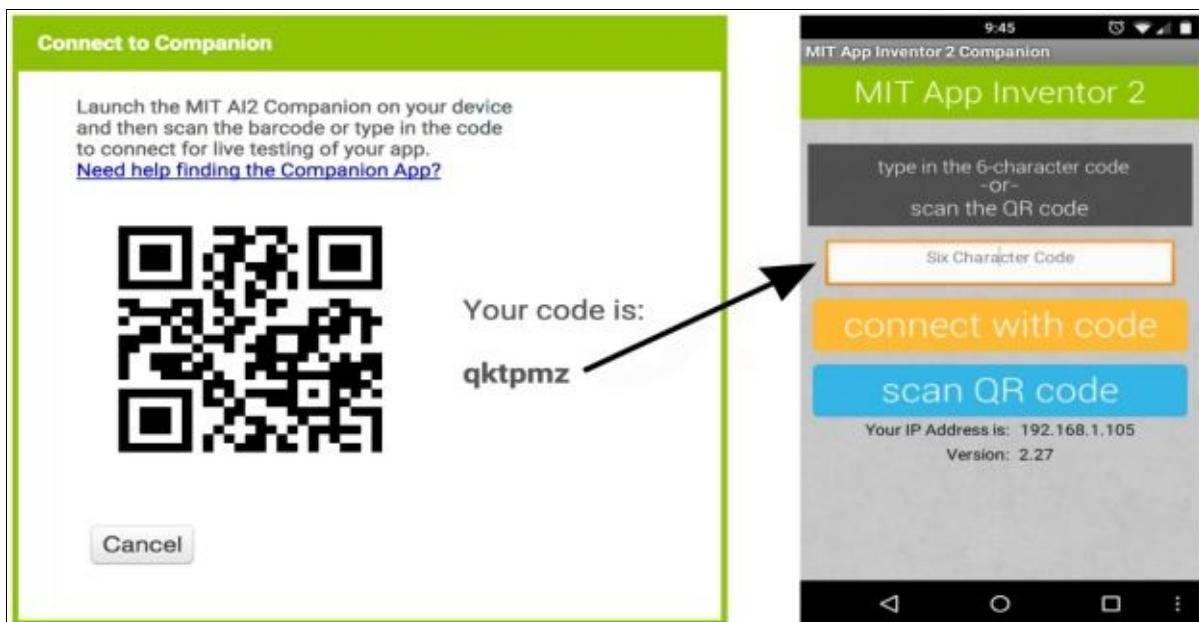

20. Now open [MIT App Inventor 2 Companion](#) in your mobile/Tablet.

And enter the code or scan the [QR code](#) from your mobile and click on connect with code.

Note:- Your Mobile/Tablet should be connected to same wi-fi/network to which your computer/Laptop is connected.

21. Now you should see your app in your phone for live testing. [Click on any Color button to draw using that color](#) and [draw anything by dragging your finger on screen](#). To clear your sketch, just shake your phone.

## Chapter 20 Texting-A messaging app

1. Click on **Start new project** and give it name **Texting** then click **OK**.

The screenshot shows the MIT App Inventor 2 interface. At the top, there's a navigation bar with links for 'Projects', 'Connect', 'Build', and 'Help'. Below that is a green header bar with buttons for 'Start new project', 'Delete Project', and 'Publish to Gallery'. The main area is titled 'My Projects' and lists several projects with their names, dates created, and modification dates. A 'Create new App Inventor project' dialog box is overlaid on the screen, prompting for a project name ('Texting') with 'Cancel' and 'OK' buttons.

## 2. Change Screen1 Title to Texting and change BackgroundColor to Red.

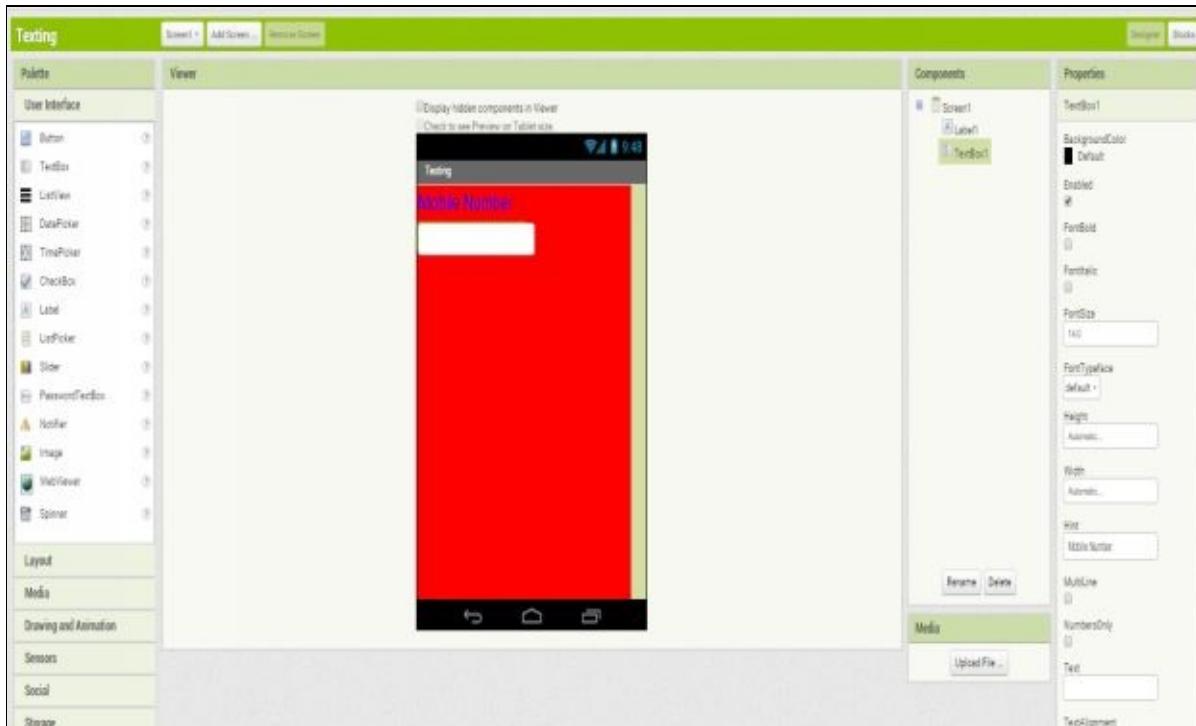

The screenshot shows the MIT App Inventor 2 Designer view for the 'Texting' project. On the left is the 'Palette' with categories like User Interface (containing Button, TextBox, ListView, etc.), Layout, Media, Drawing and Animation, Sensors, Social, Storage, Connectivity, and LEGO MINDSTORMS. The central area is the 'Viewer' showing a mobile phone screen with a red background and the title 'Texting'. The right side shows the 'Components' and 'Properties' panels for the 'Screen1' component. In the Components panel, 'Screen1' is selected. In the Properties panel, the 'Title' property is set to 'Texting', the 'BackgroundColor' is set to 'Red', and the 'Name' is listed as 'Texting'. Other properties like 'AboutScreen', 'AlgorHoriz', 'AlgorVert', 'AppIcon', 'BackgroundImage', 'CloseScreenAnimation', 'Icon', 'OpenScreenAnimation', 'ScreenOrientation', 'Scalable', 'ShowStatusBar', 'String', and 'Title' are also visible.

## 3. Drag a Label from Palette to Viewer screen and change its Text to Mobile Number.

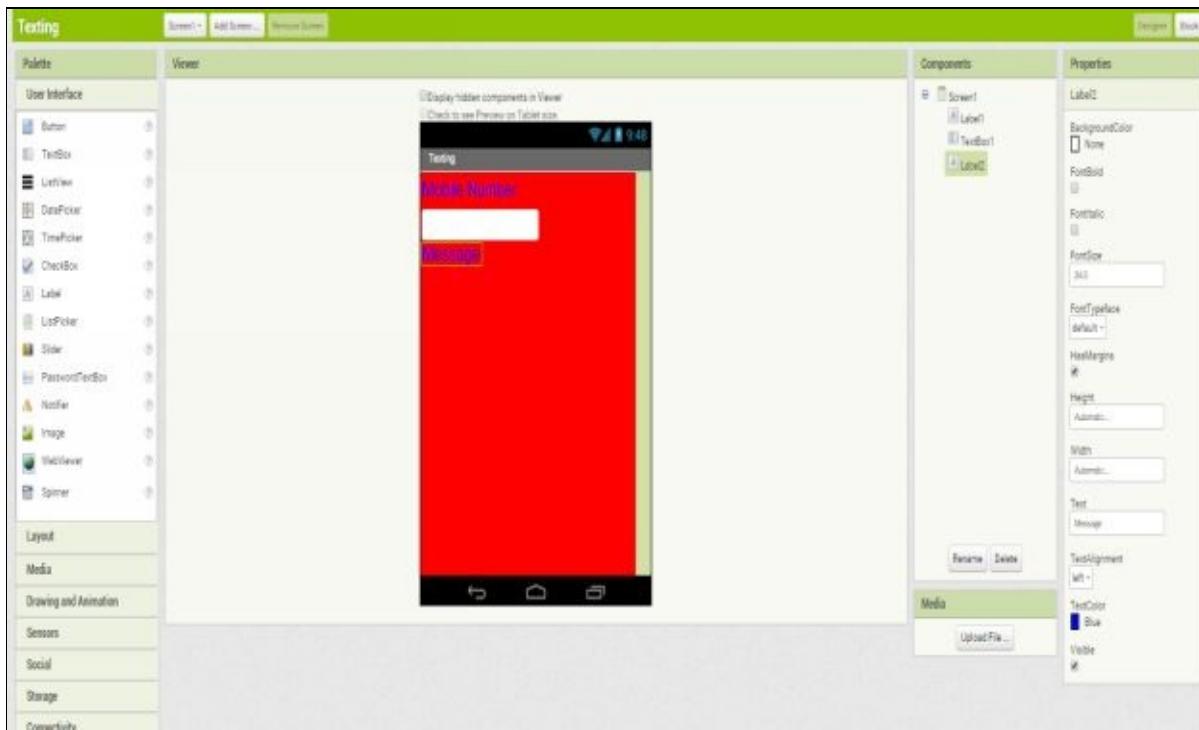

Set its Properties as shown below.

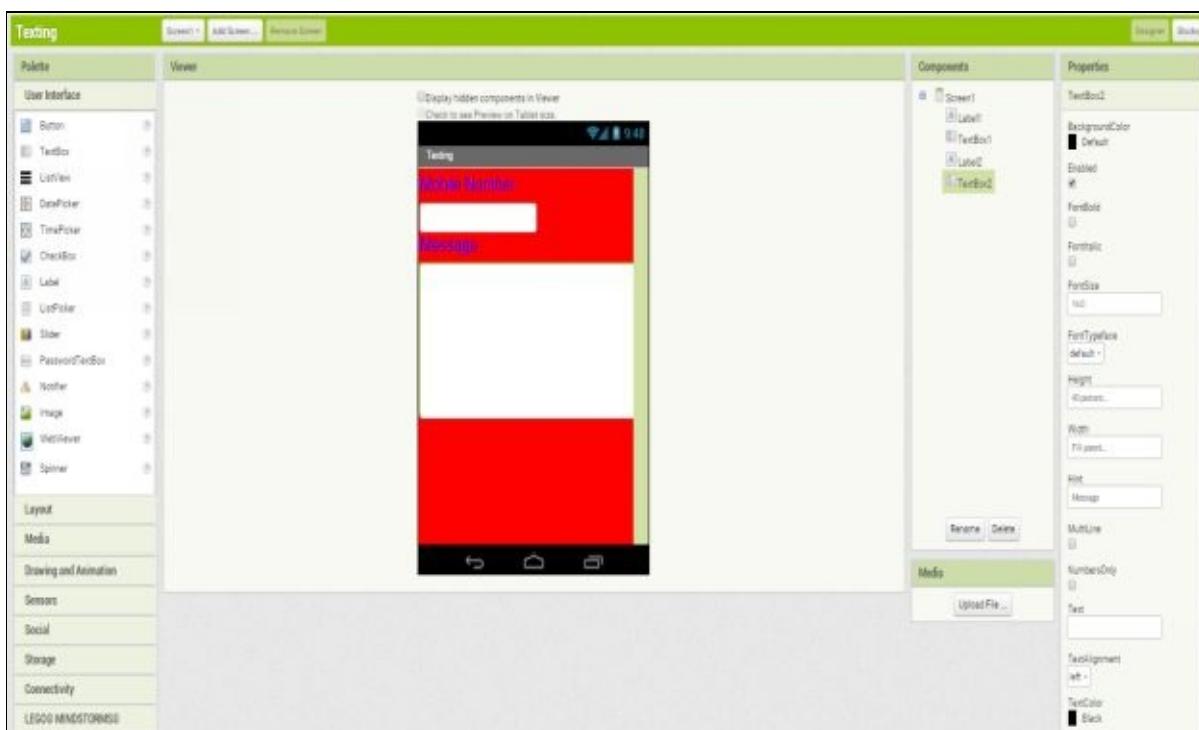

4. Drag a **TextBox** from **Palette** to **Viewer** screen and change its **Hint Text** to ‘Mobile Number’.

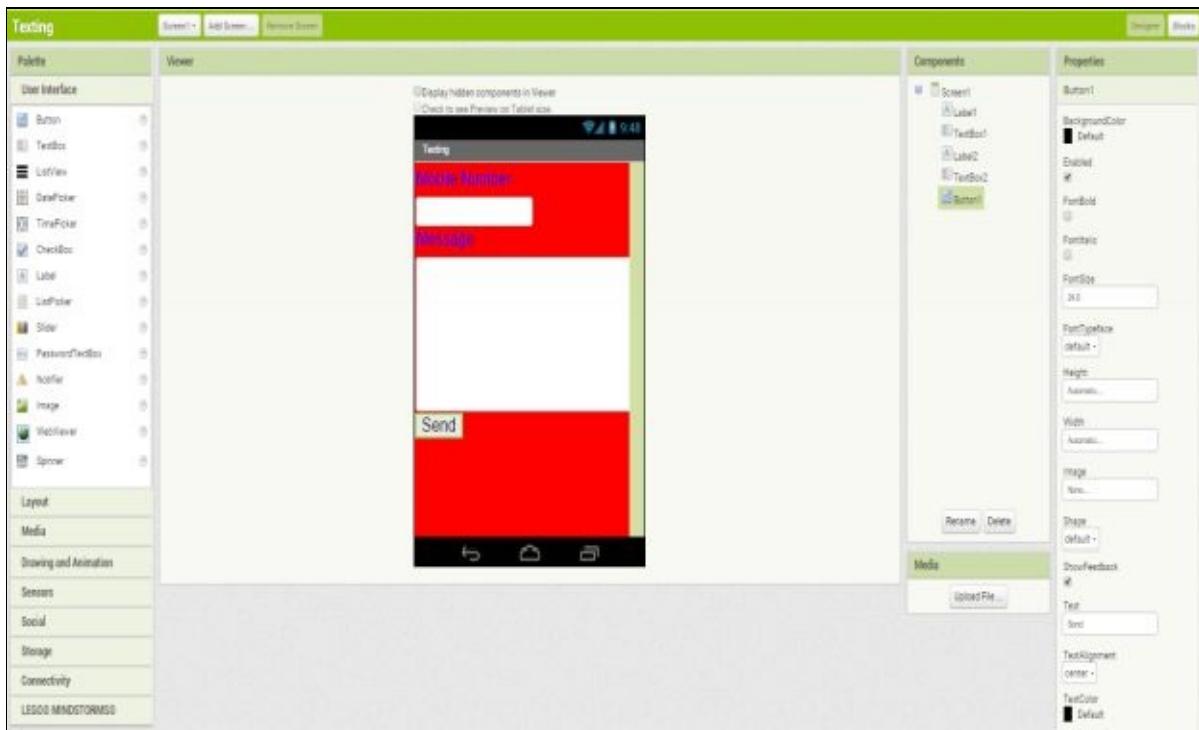

5. Drag a **Label** from **Palette** to **Viewer** screen and change its **Text** to ‘Message’. Set its **Properties** as shown below.

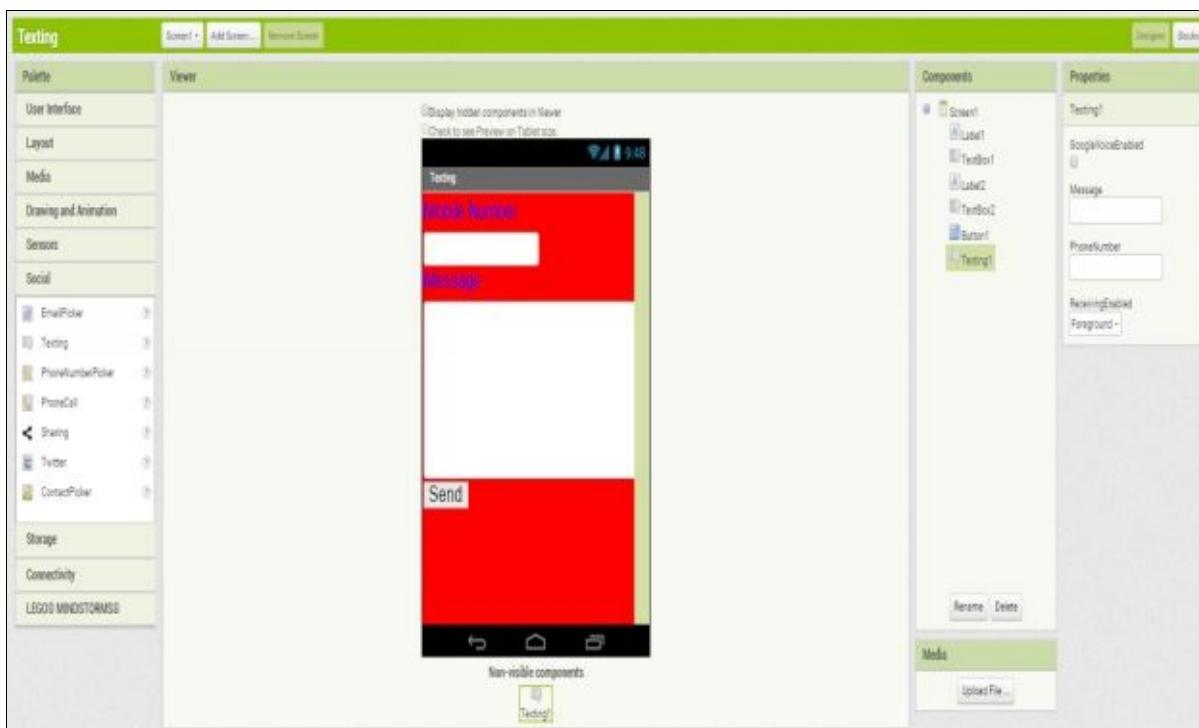

6. Drag a **TextBox** from **Palette** to **Viewer** screen and set its **Height** to **40** percent and **Width** to **Fill parent**. Change it's **Hint Text** to '**Message**'.

7. Drag a **Button** from **Palette** to **Viewer** screen and change it's **Text** to **Send** and **FontSize** to **24.0**.

## 8. Drag a Texting (Non-visible) component from Palette to Viewer.

```
when Button1 .Click
do [ ]
```

## 9. Go to Blocks and click on Button1 and select [ ] block. This is an event block which will decide what your app will do when this button will be clicked. Here click is an event for Button1 component.

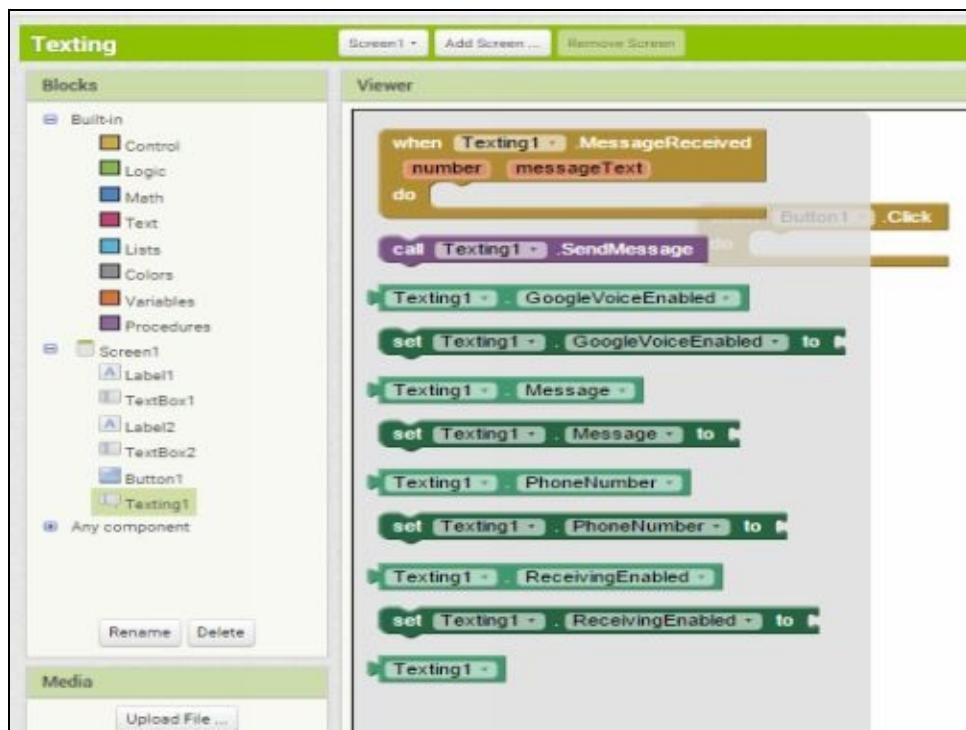

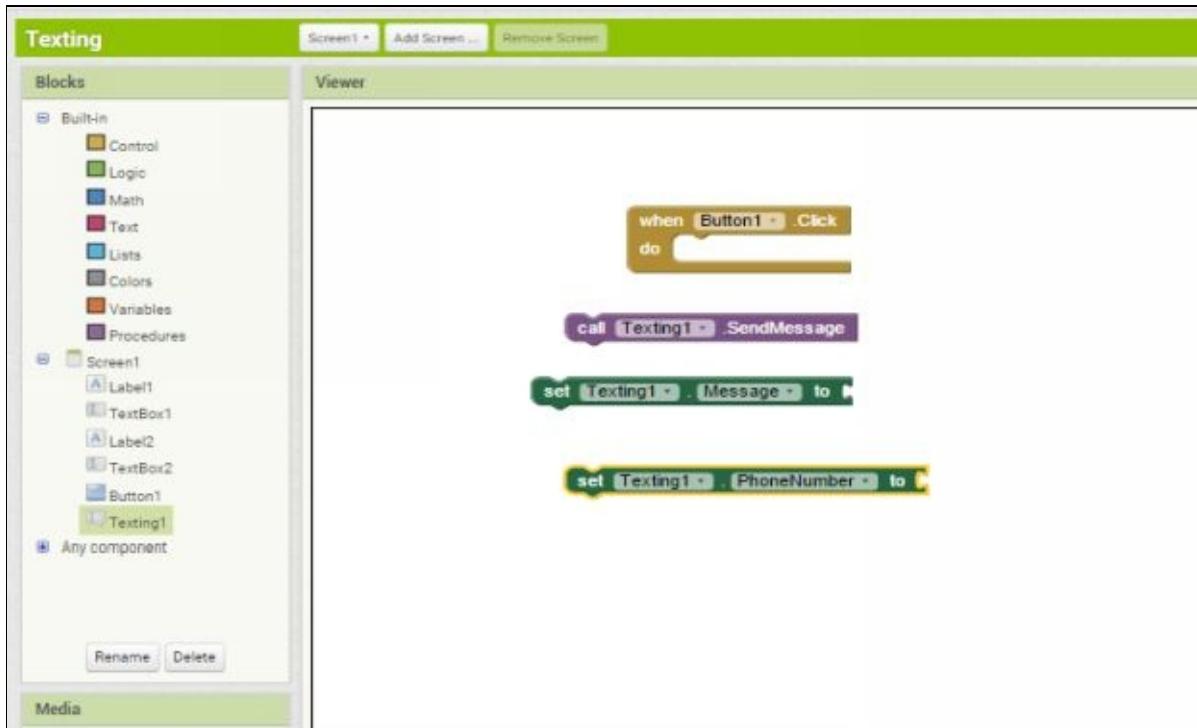

`set Texting1 . PhoneNumber to`

`set Texting1 . Message to`

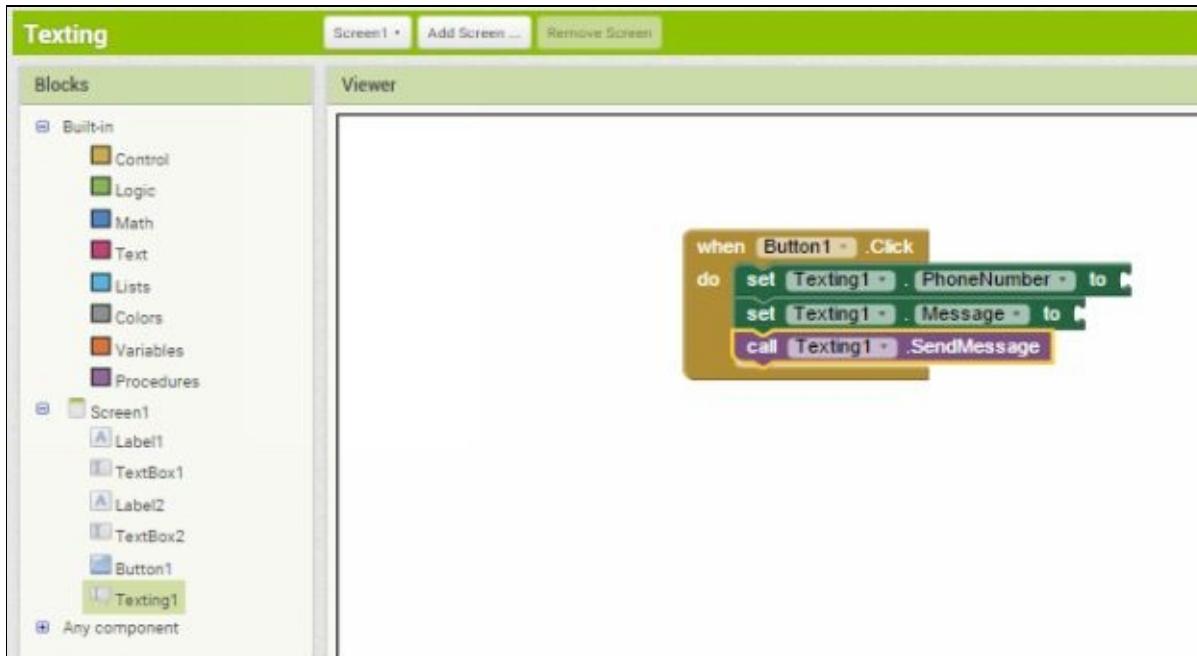

`call Texting1 . SendMessage`

10. Click on **Texting1** and select **blocks**. Texting component will use your Phone's messaging and send a message to a PhoneNumber. These blocks will set PhoneNumber and Message to be sent.

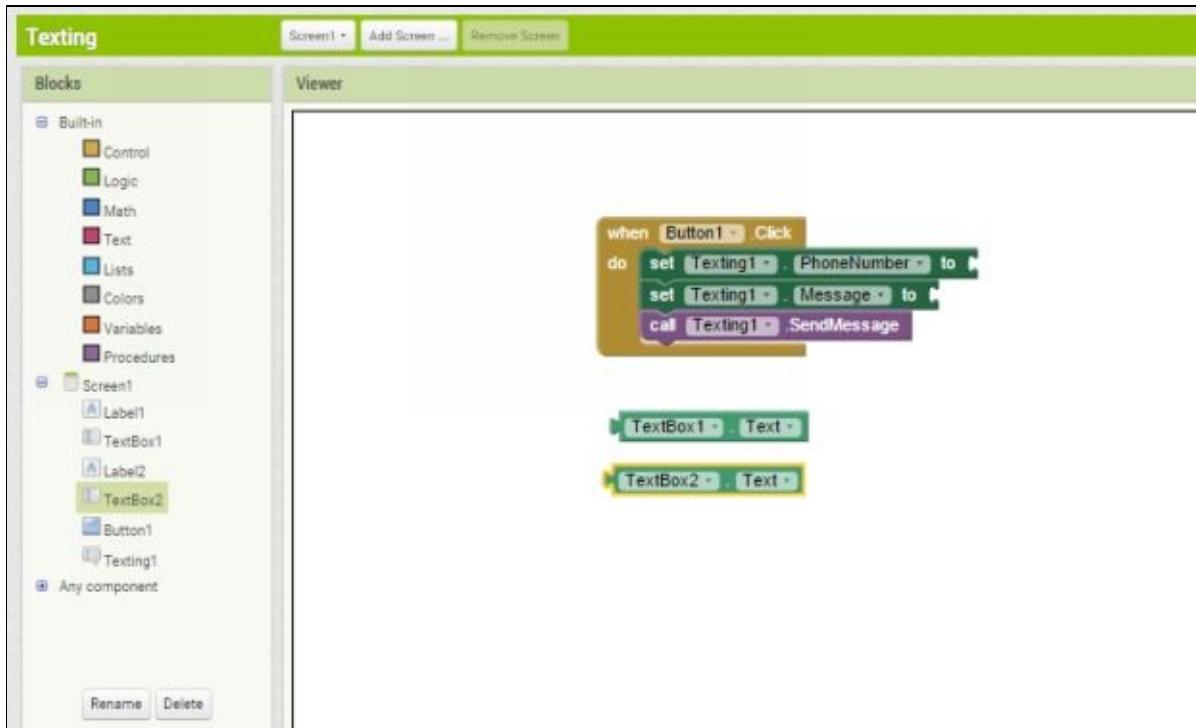

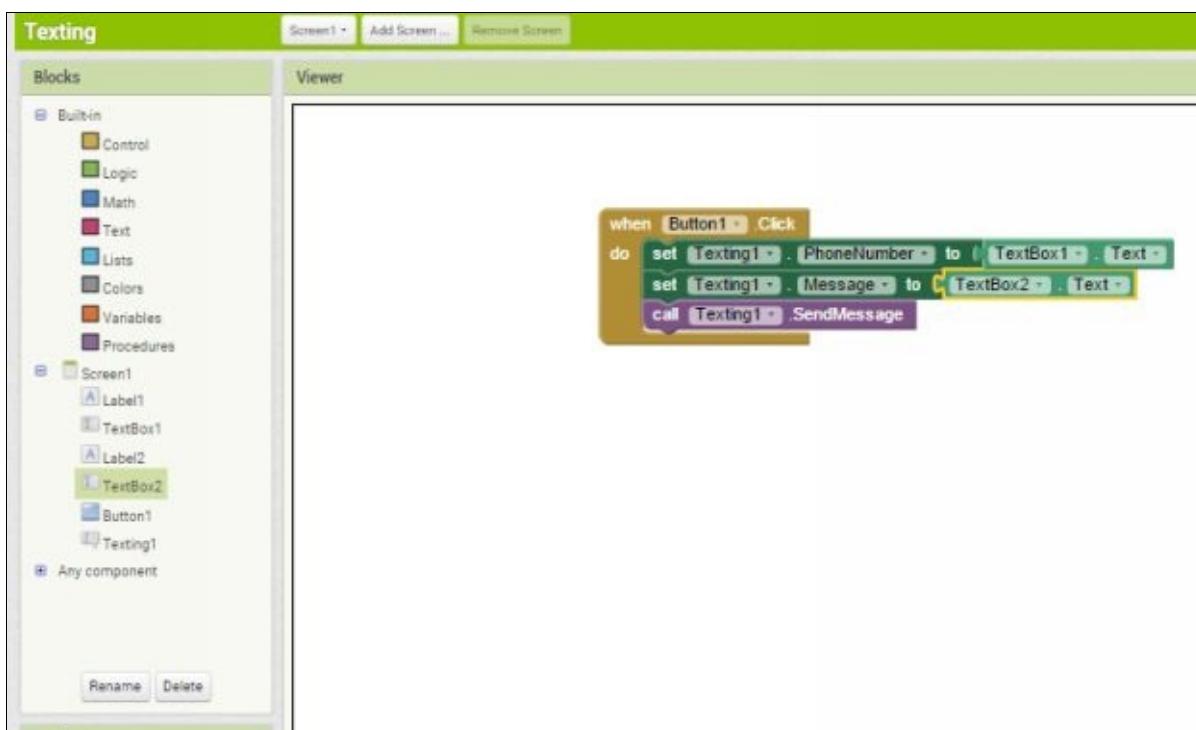

11. Attach the **blocks** as shown below. So when you click Button1 it will set Phone number and message and then call Texting1.SendMessage to send Message.

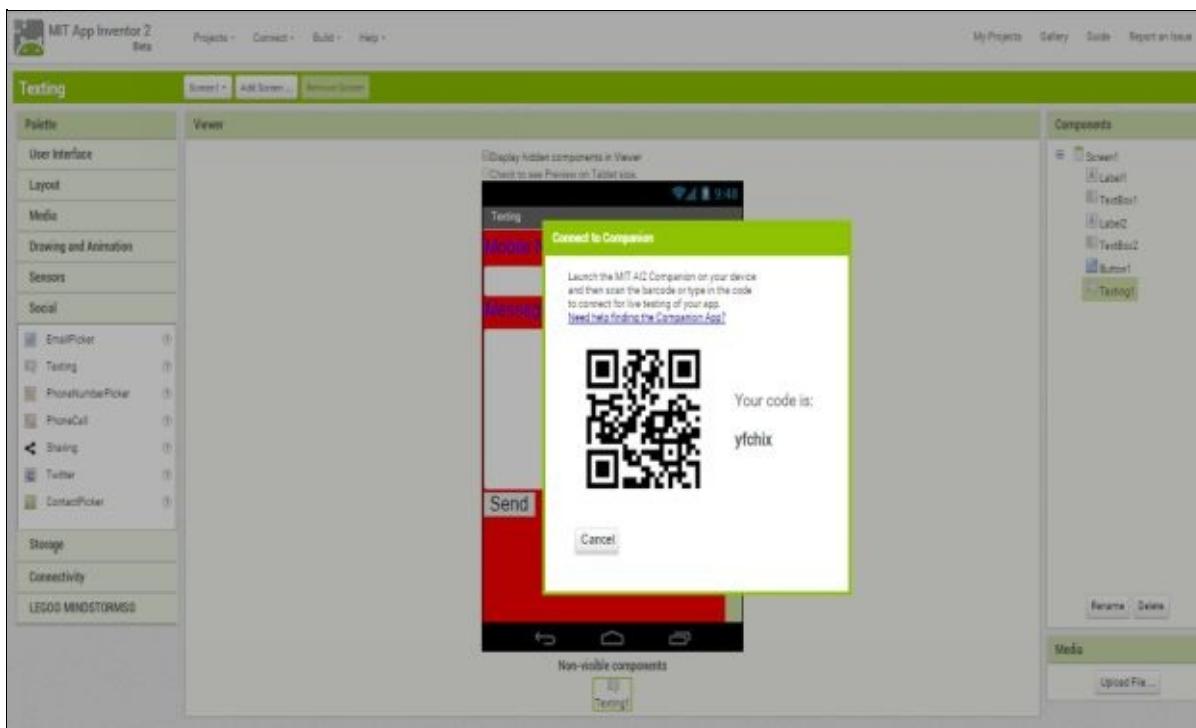

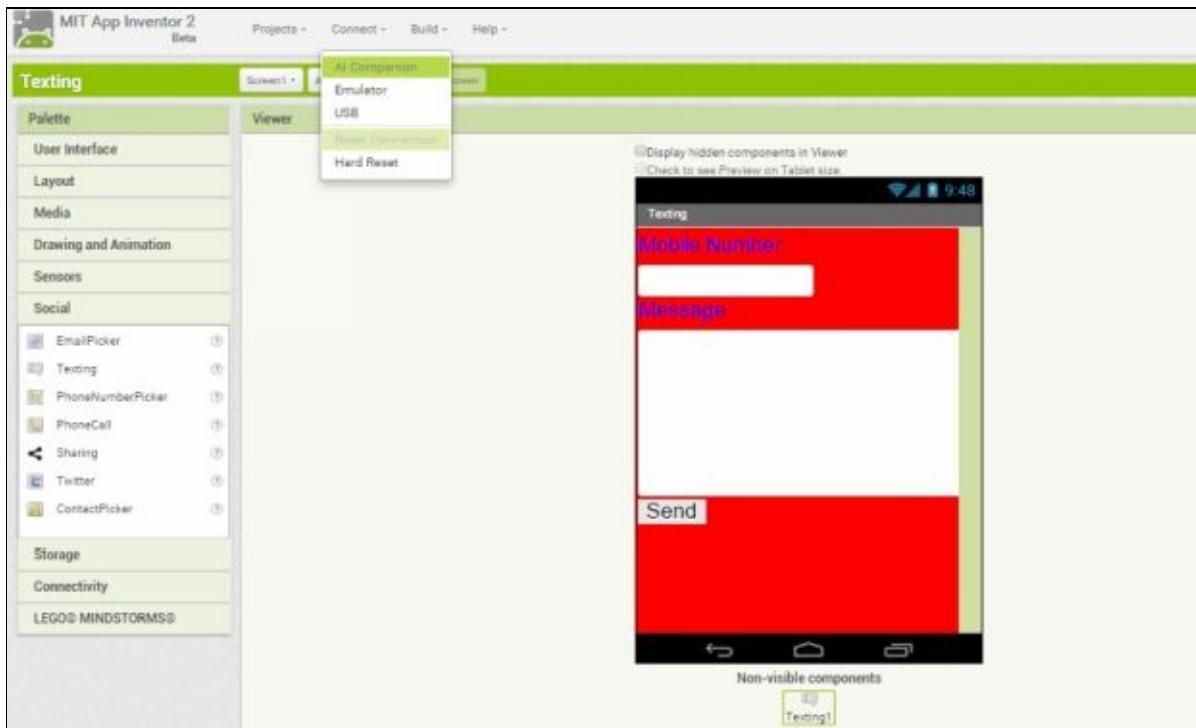

12. Click on **TextBox1** and **TextBox2** and scroll down to select **blocks**. Here TextBox1.Text represents Phone number and TextBox2.Text represents Message.

13. Attach the **blocks** as shown below.

14. Go to **Designer** and click on **Connect** and then select **AI Companion**.

15. Now open [MIT App Inventor 2 Companion](#) in your mobile/Tablet.

And enter the code or scan the [QR code](#) from your mobile and click on connect with code.

Note:-Your Mobile/Tablet should be connected to same wi-fi/network to which your computer/Laptop is connected.

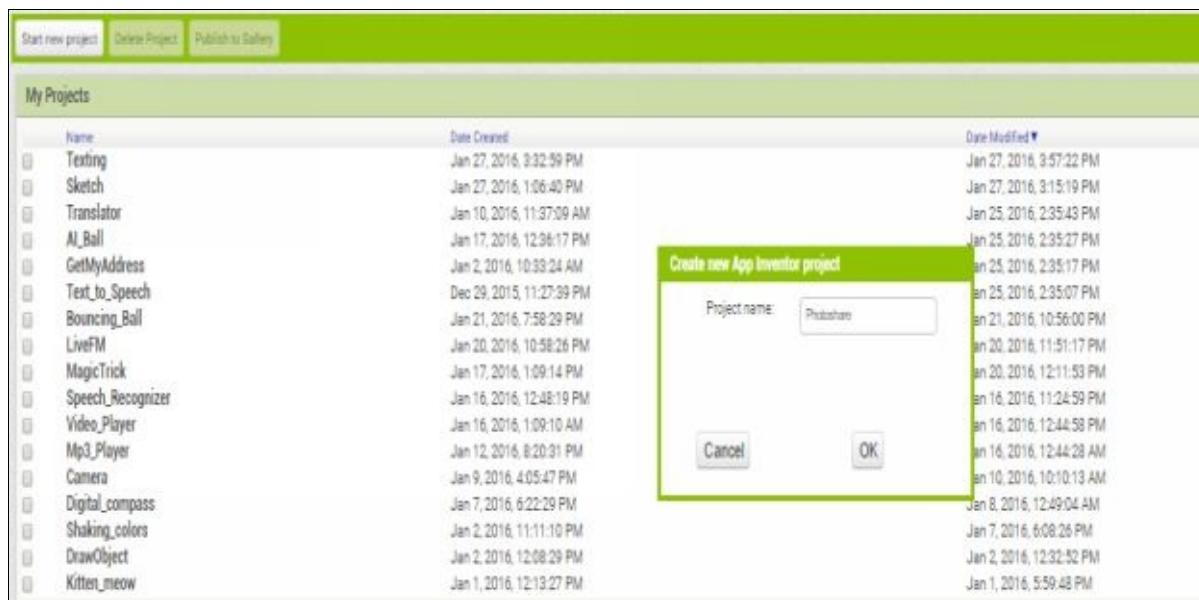

16. Now you should see your app in your phone for live testing. [Enter Mobile number](#) and [Message](#) and click [Send](#) button to send message.

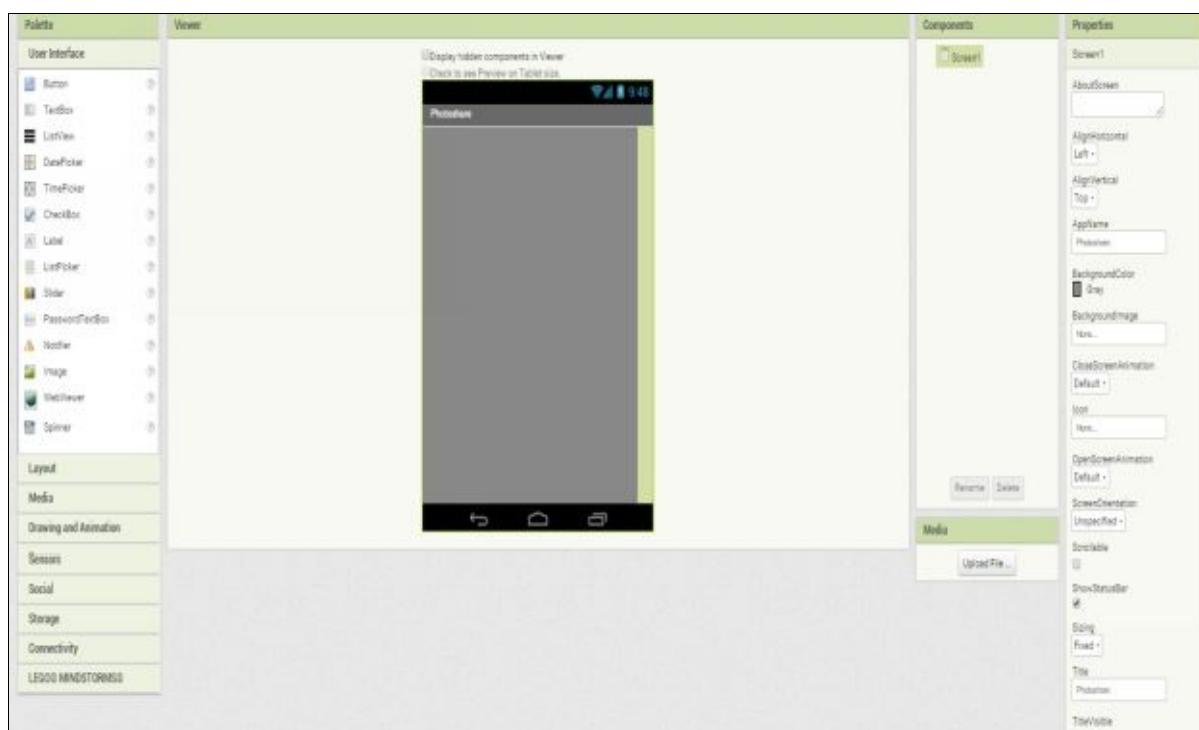

# Chapter 21 Photo share app

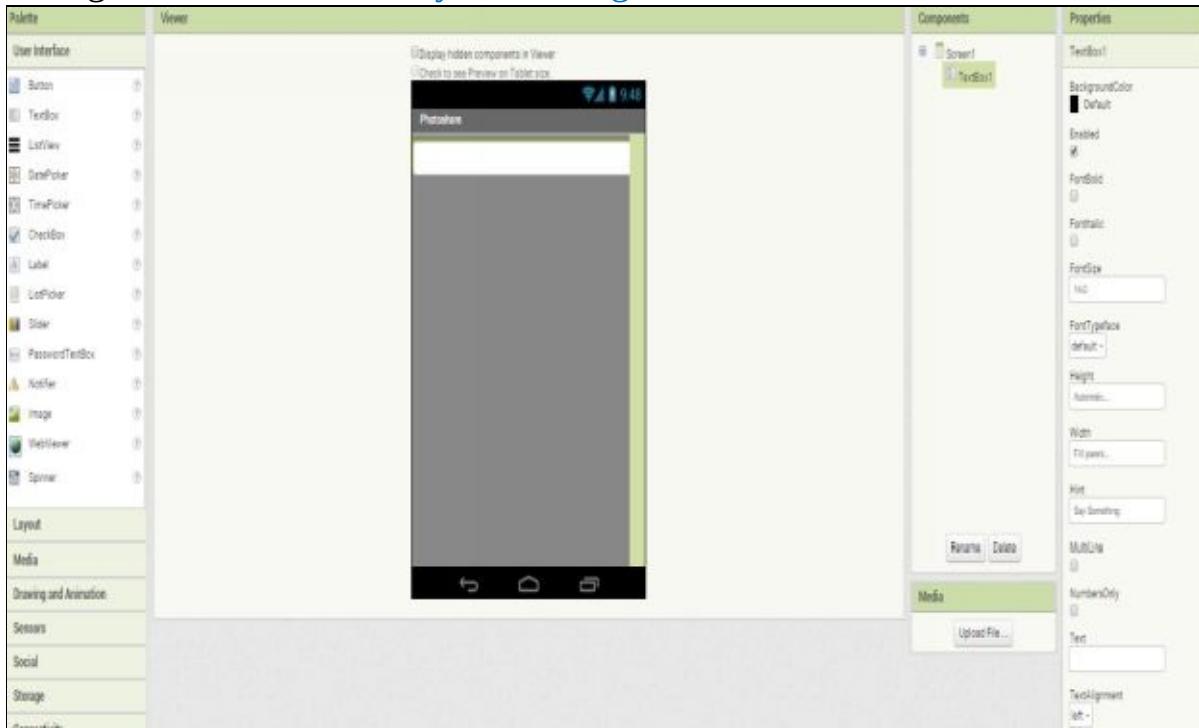

1. Click on **Start new project** and give it name **Photoshare** then click **OK**.

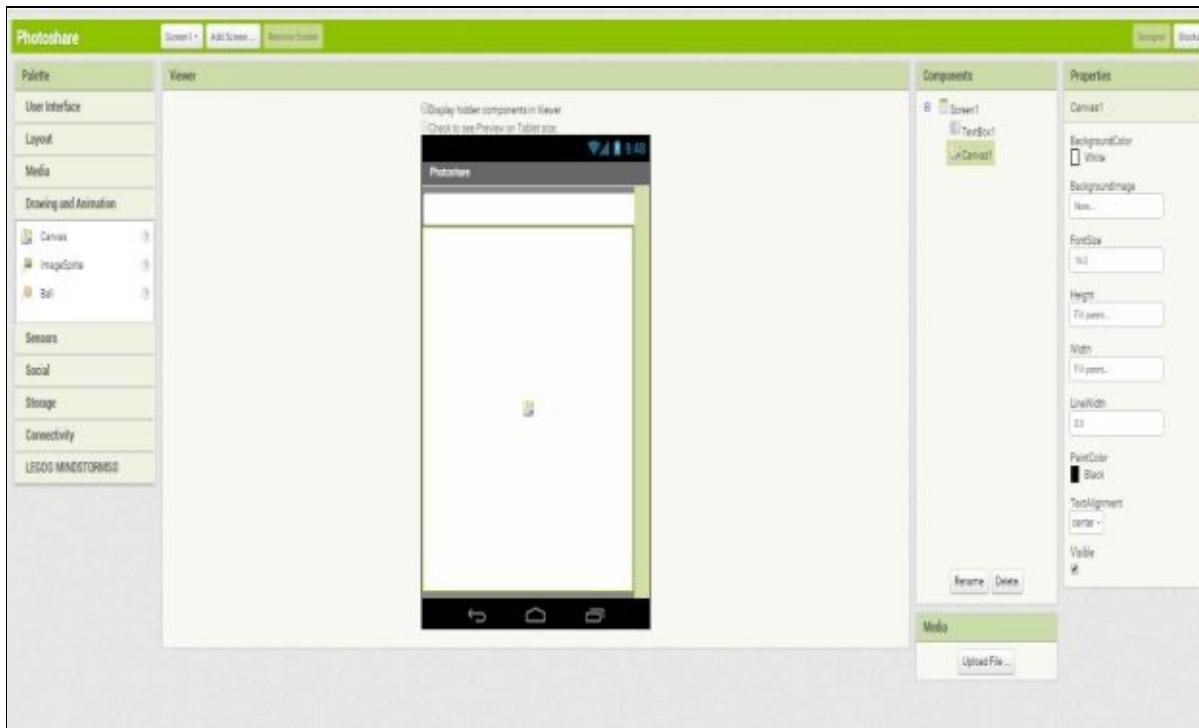

2. Change **Screen1 Title** to **Photoshare** and change **BackgroundColor** to **Gray**.

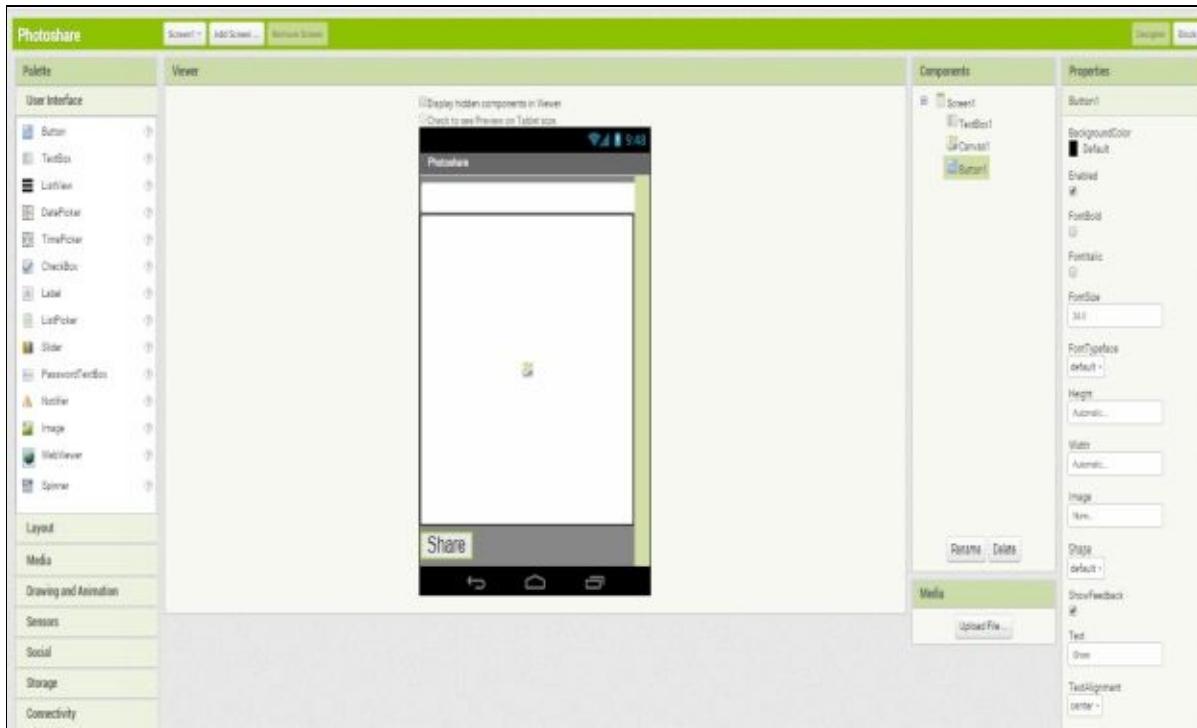

3. Drag a **TextBox** from **Palette** to **Viewer** screen and set it's **Width** to **Fill parent** and Change it's **Hint Text** to '**Say Something**'.

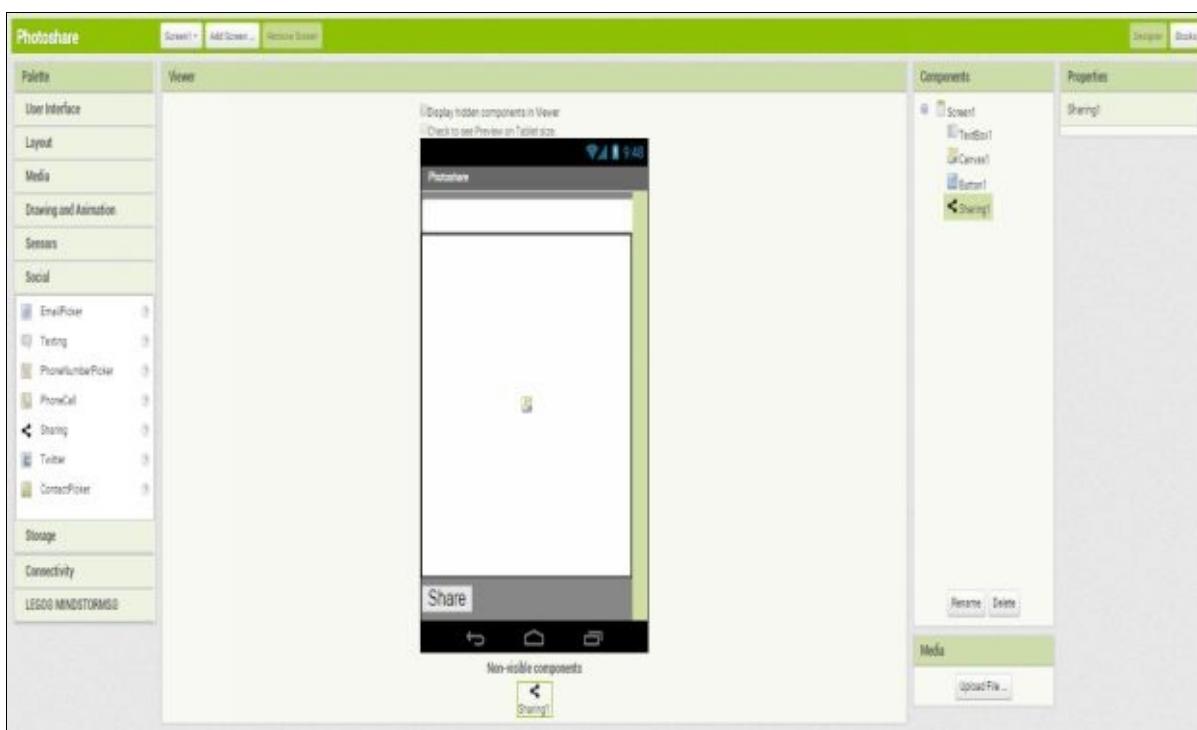

4. Now Drag a **Canvas** from **Palette** to **Viewer** screen and set it's **Height** and **Width** to **Fill parent**.

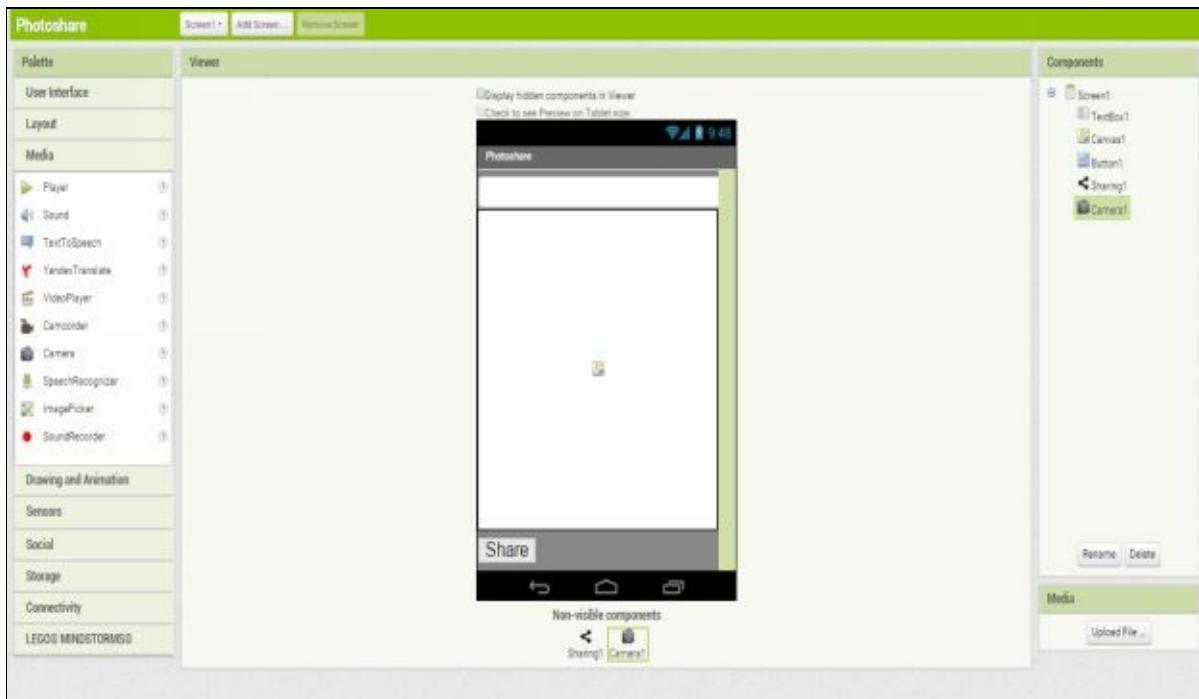

5. Now Drag a **Button** from **Palette** to **Viewer** and change it's **Text** to '**Share**'. Change it's **FontSize** to **24.0**.

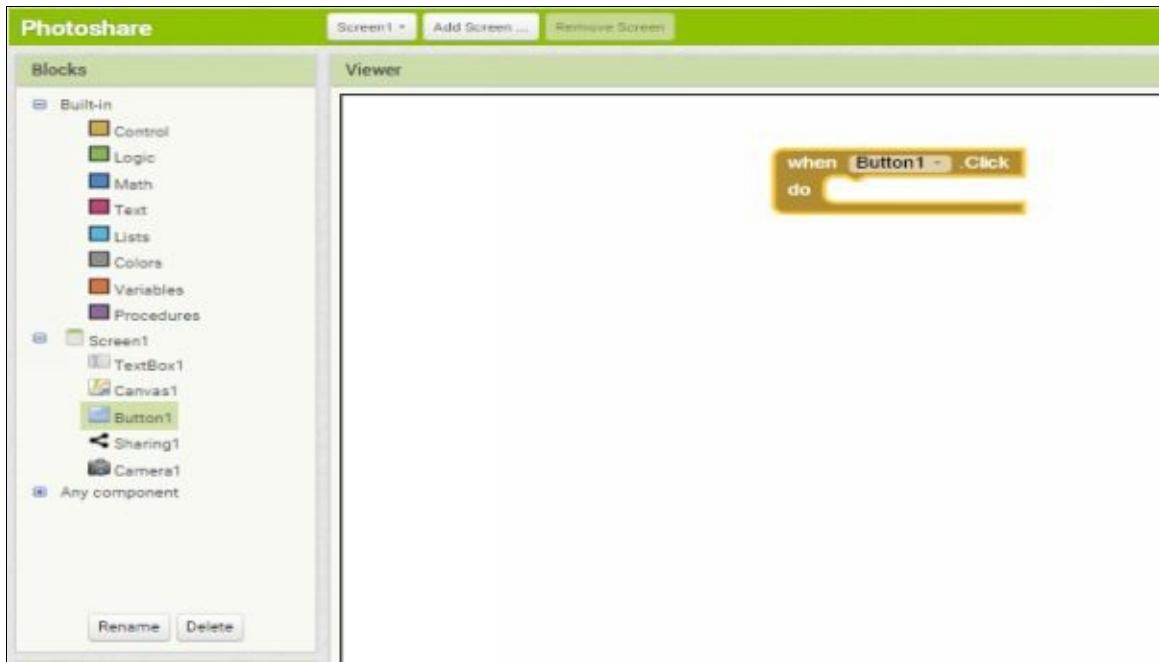

## 6. Drag a Sharing (Non-visible) component from Palette to Viewer.

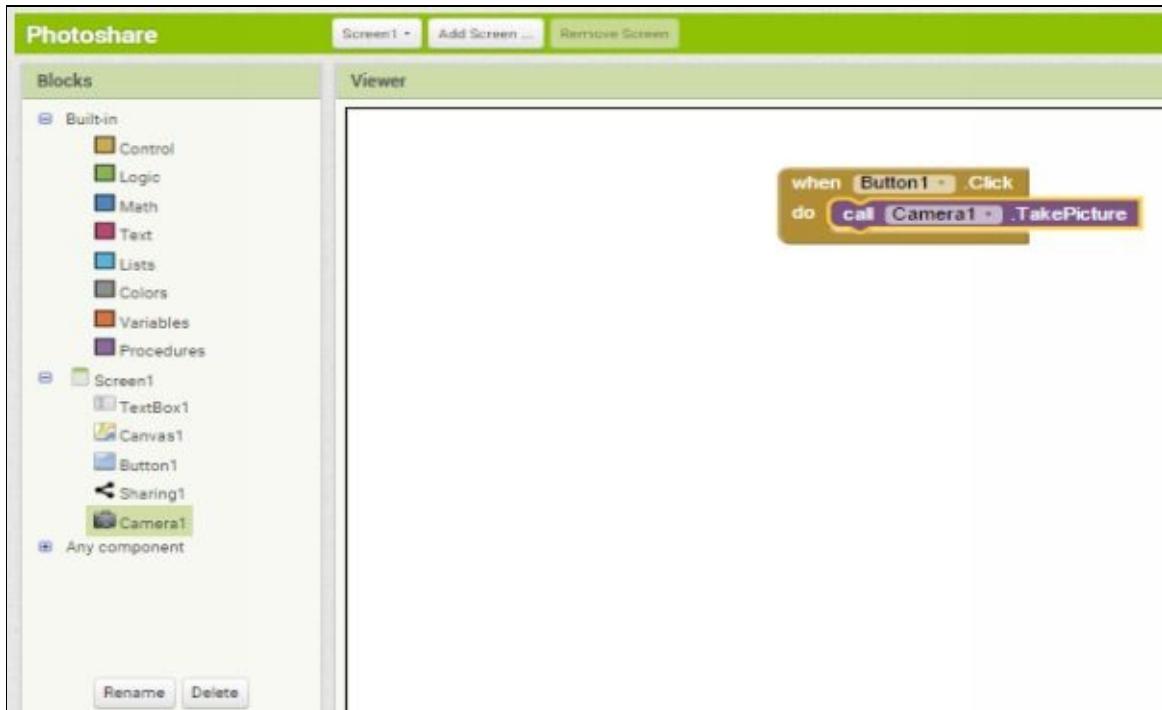

## 7. Drag a Camera (Non-visible) component from Palette to Viewer.

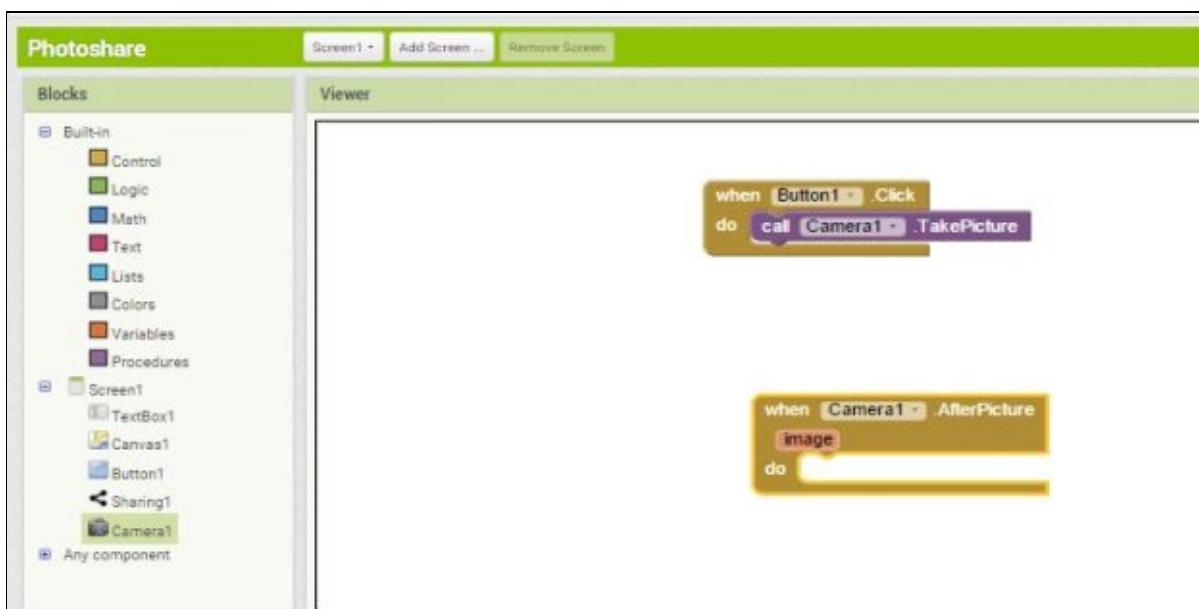

8. Go to **Blocks** and click on **Button1** and select **when [Button1].Click** block. This is an event block which will decide what your app will do when this button will be clicked. Here click is an event for Button1 component.

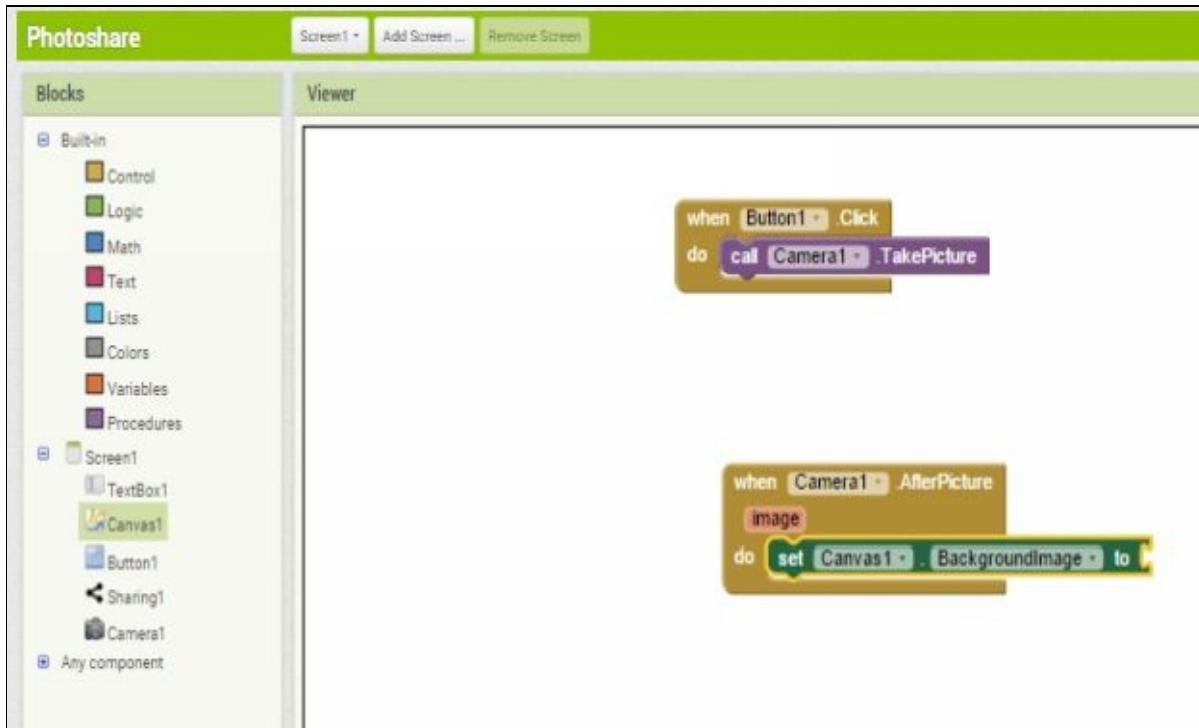

9. Click on **Camera1** and select **call [Camera1].TakePicture** block. When you click Button1 ,app will open your device's camera to take picture.

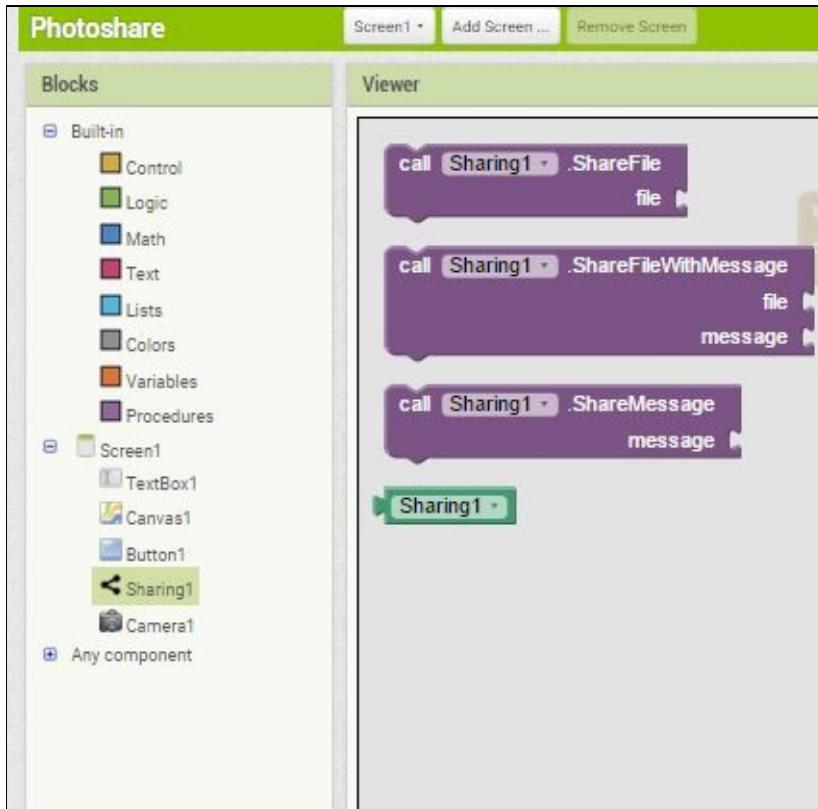

10. Click on **Camera1** and select block. This block will decide what to do after taking picture.

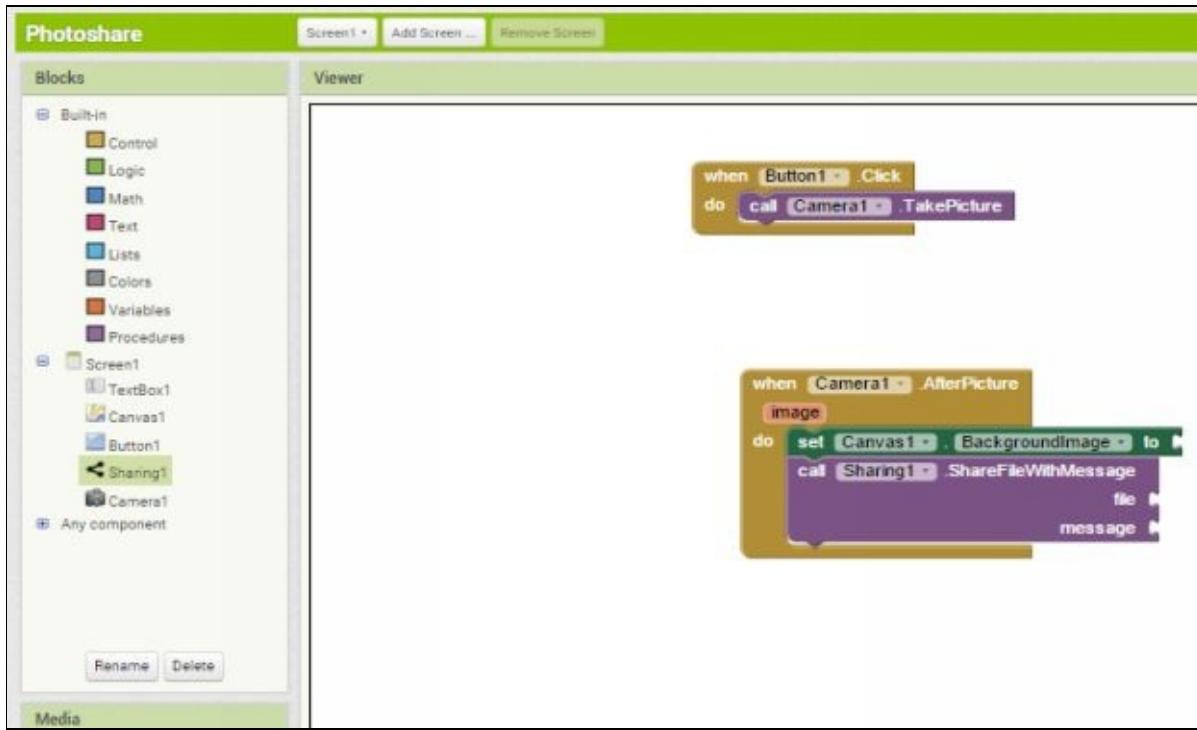

11. Click on **Canvas1** and select block. This block will set the Canvas BackgroundImage.

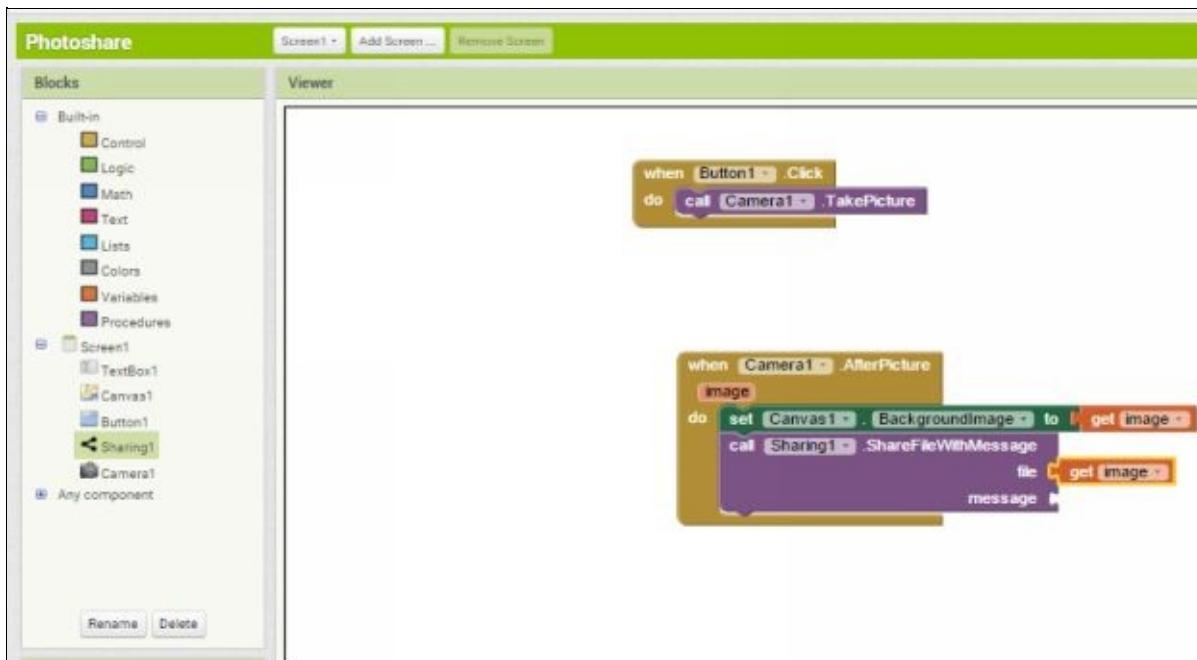

12. Click on **Sharing1** and select **call Sharing1 .ShareFileWithMessage** block. Sharing component will open all the sharing apps from your phone through which you can share a message or file or Both.

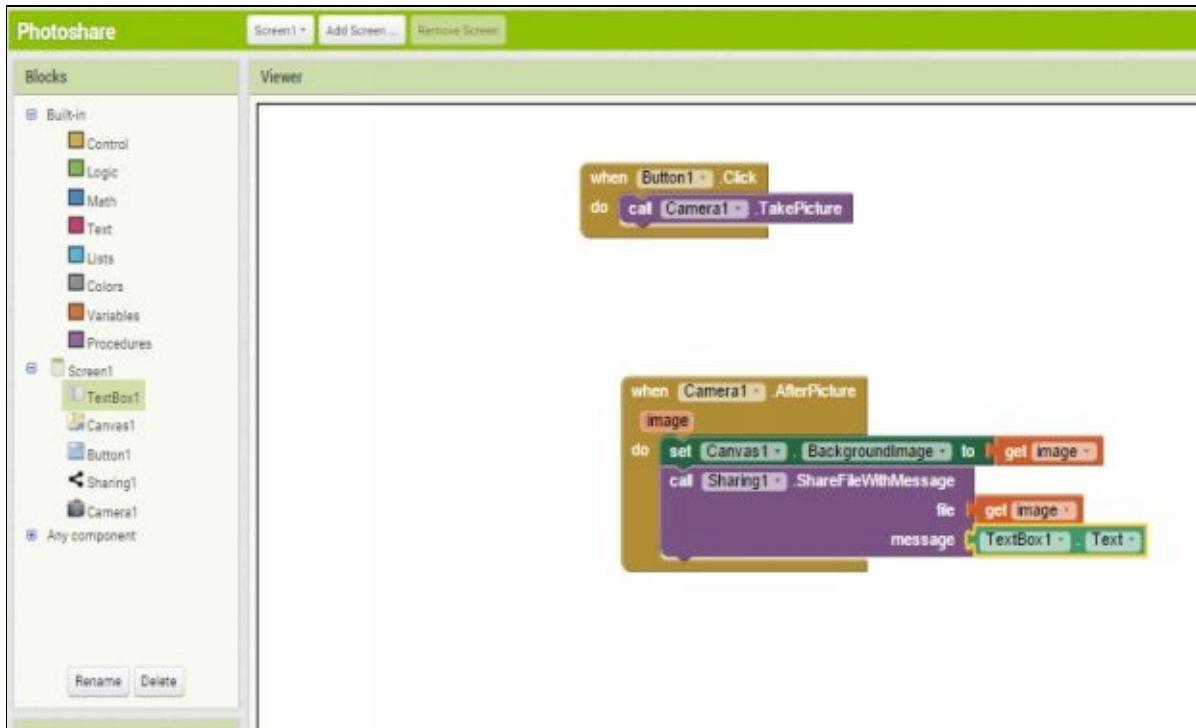

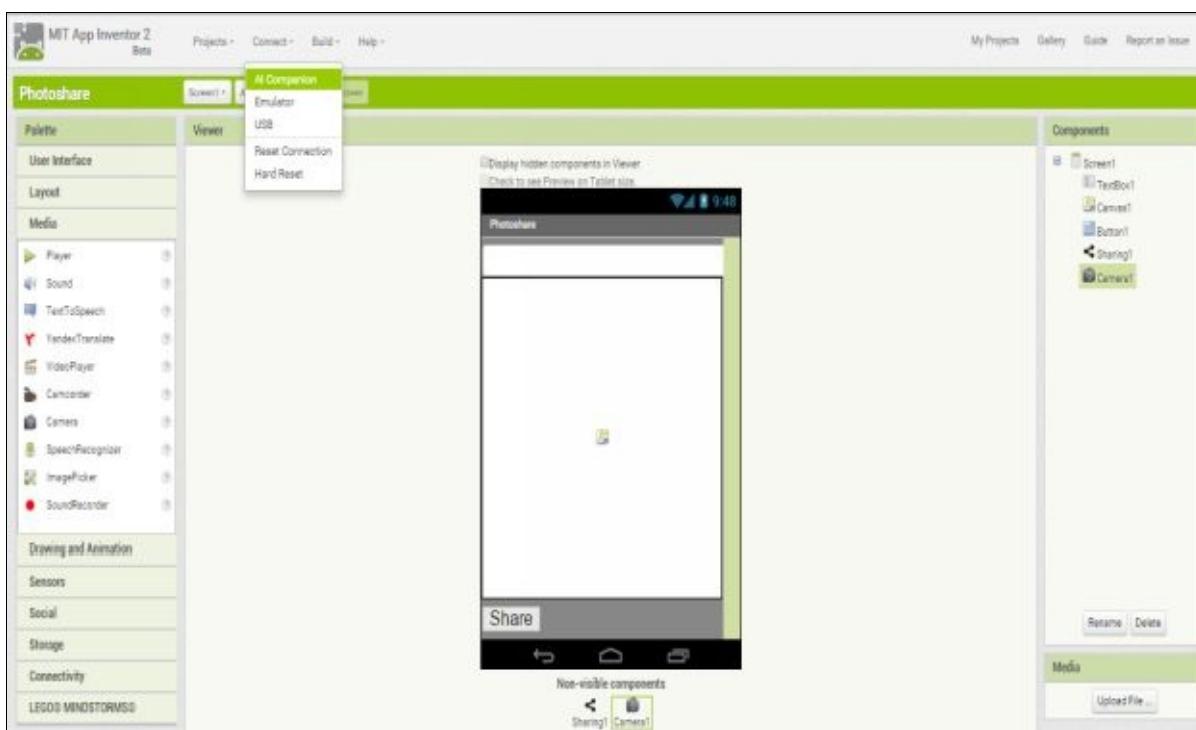

13. Mouse over on **image** and select **block**. This block will return the image taken by Camera.

14. Click on **TextBox1** and scroll down to select **block**. So after taking picture Canvas BackgroundImage will be changed to the picture taken by camera and app will show you a window to choose app to share your app and message.

15. Go to **Designer** and click on **Connect** and select **AI Companion**.

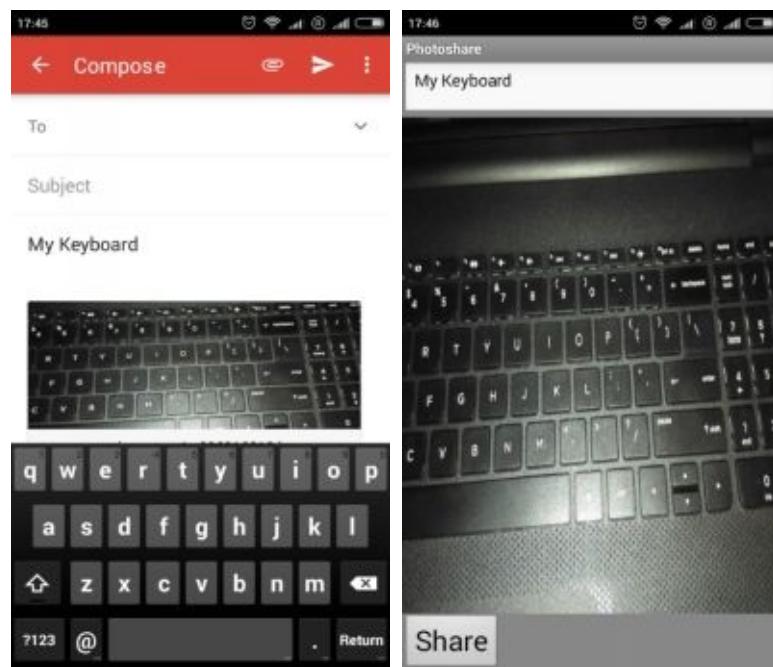

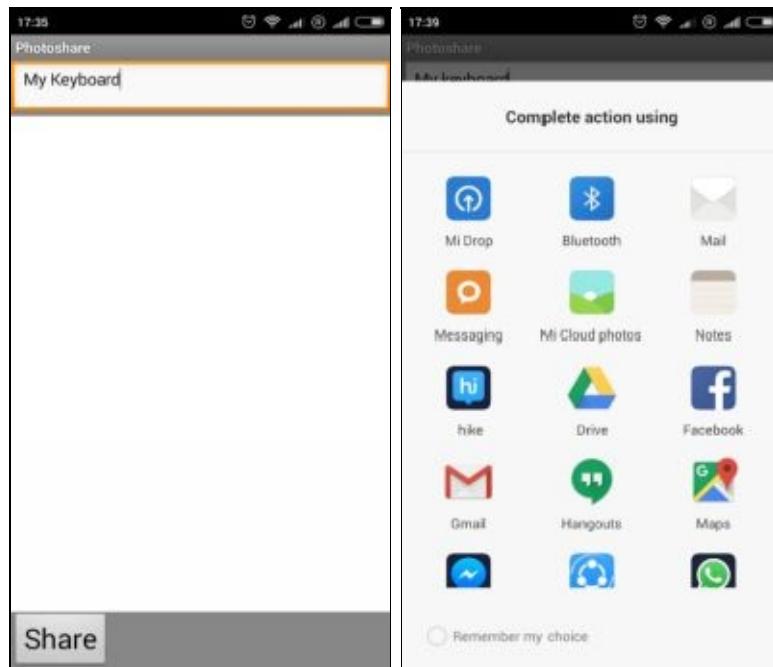

16. Now open MIT App Inventor 2 Companion in your mobile/Tablet. And enter the code or scan the QR code from your mobile and click on connect with code. Note:- Your Mobile/Tablet should be connected to same wi-fi/network to which your computer/Laptop is connected.

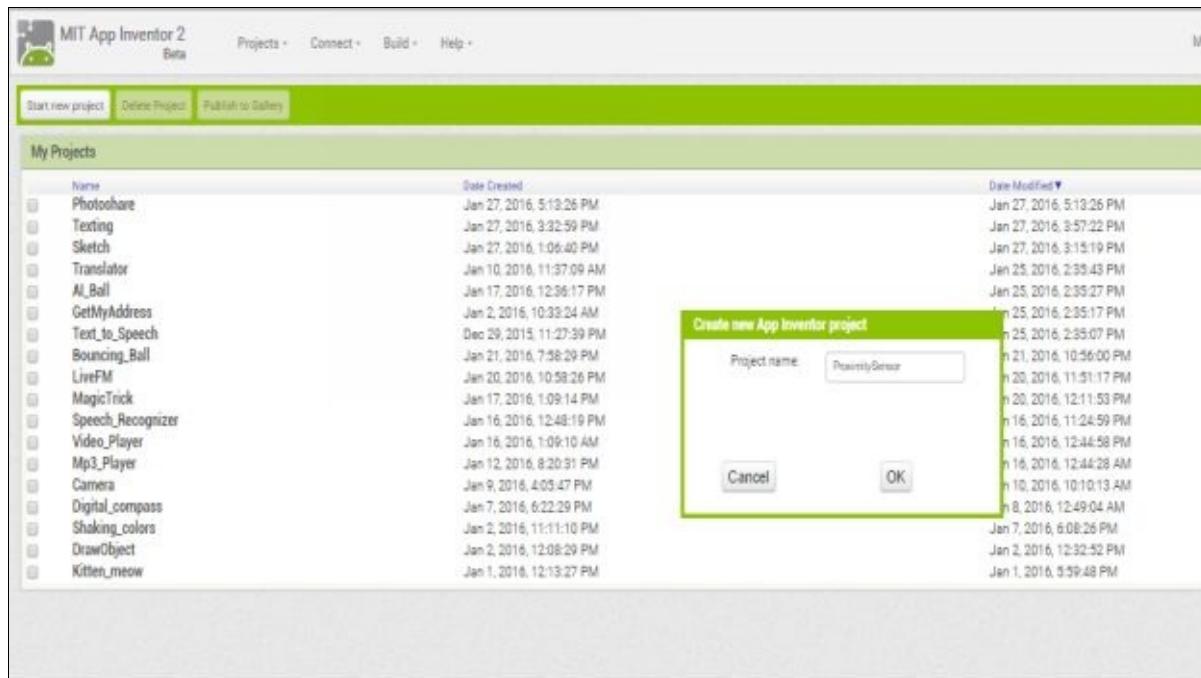

17. Now you should see your app in your phone for live testing. Enter some text in TextBox and click on Share button to take picture and share. When you click on Share button your device camera will open to take picture and when you take picture it will show all the apps using which you can share your Message with your picture taken.

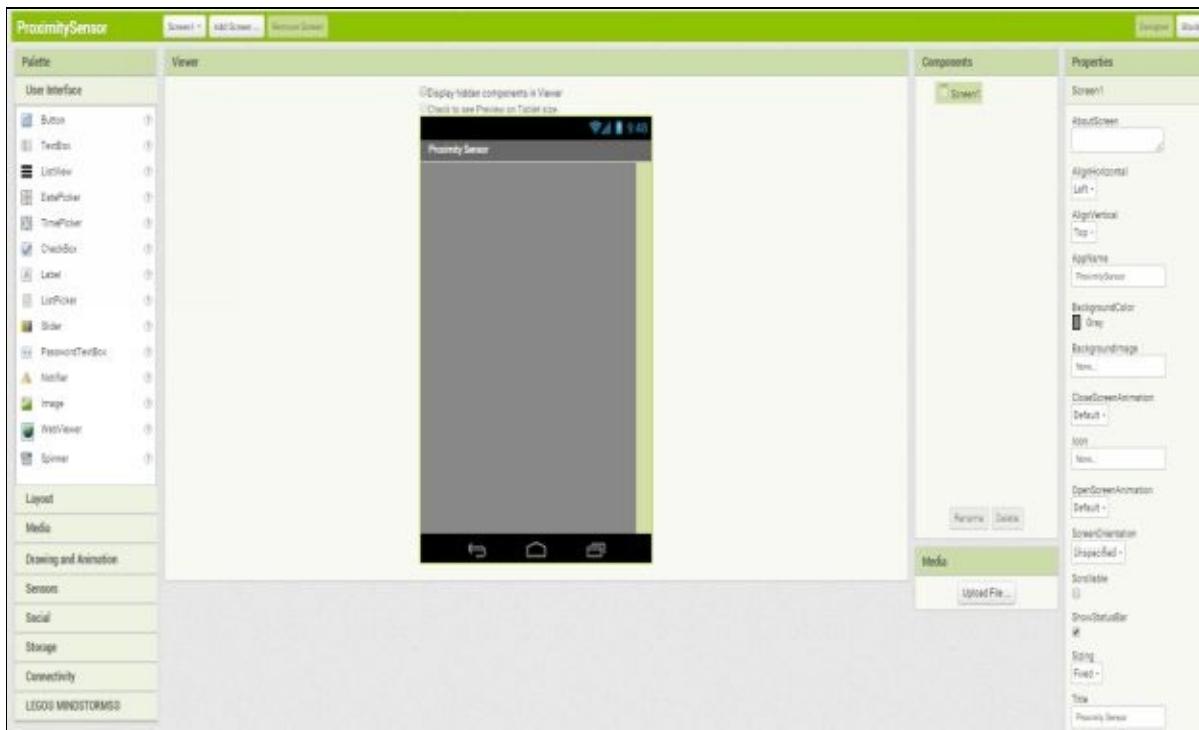

## Chapter 22 Proximity Sensor app

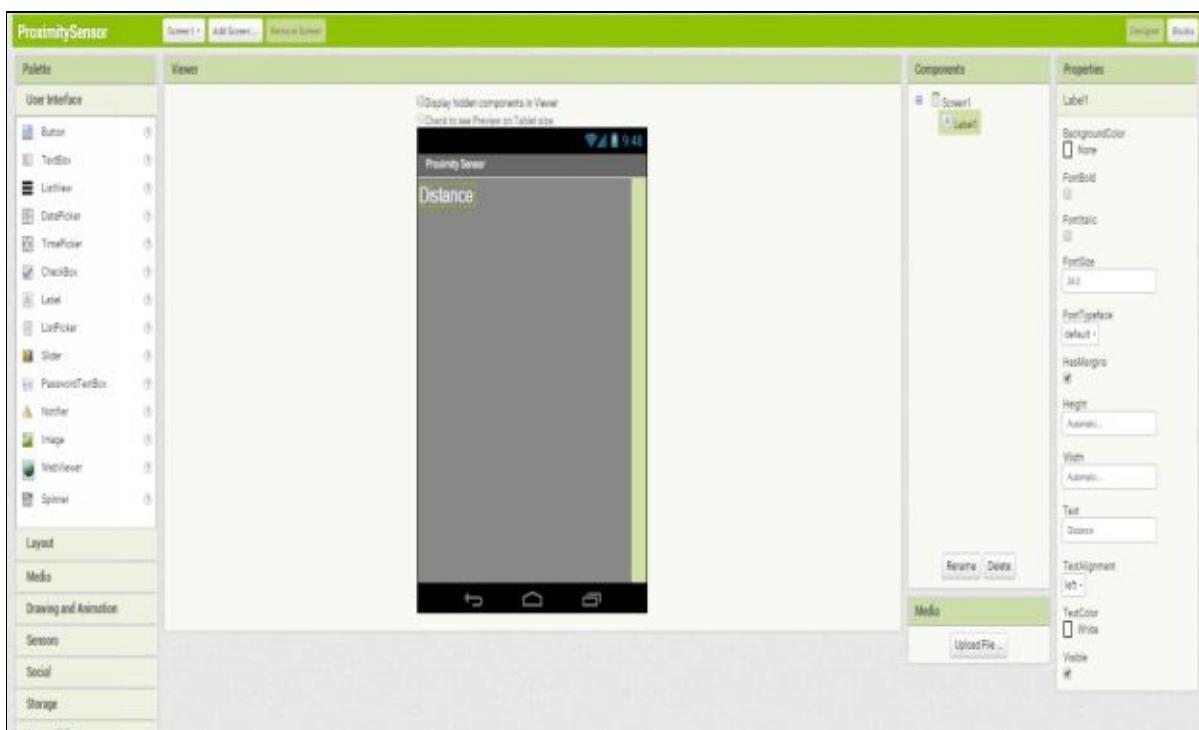

1. Click on **Start new project** and give it name **ProximitySensor** and click **OK**.

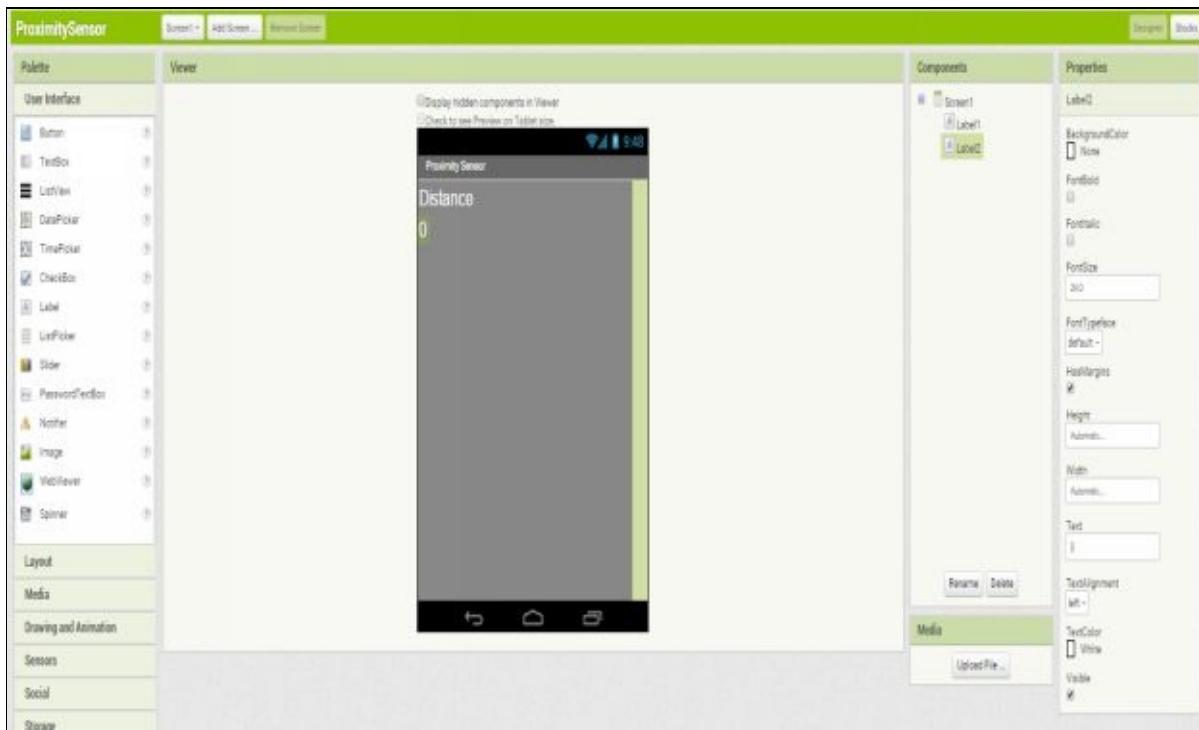

2. Change **Screen1 Title** to '**Proximity Sensor**' and **BackgroundColor** to **Gray**.

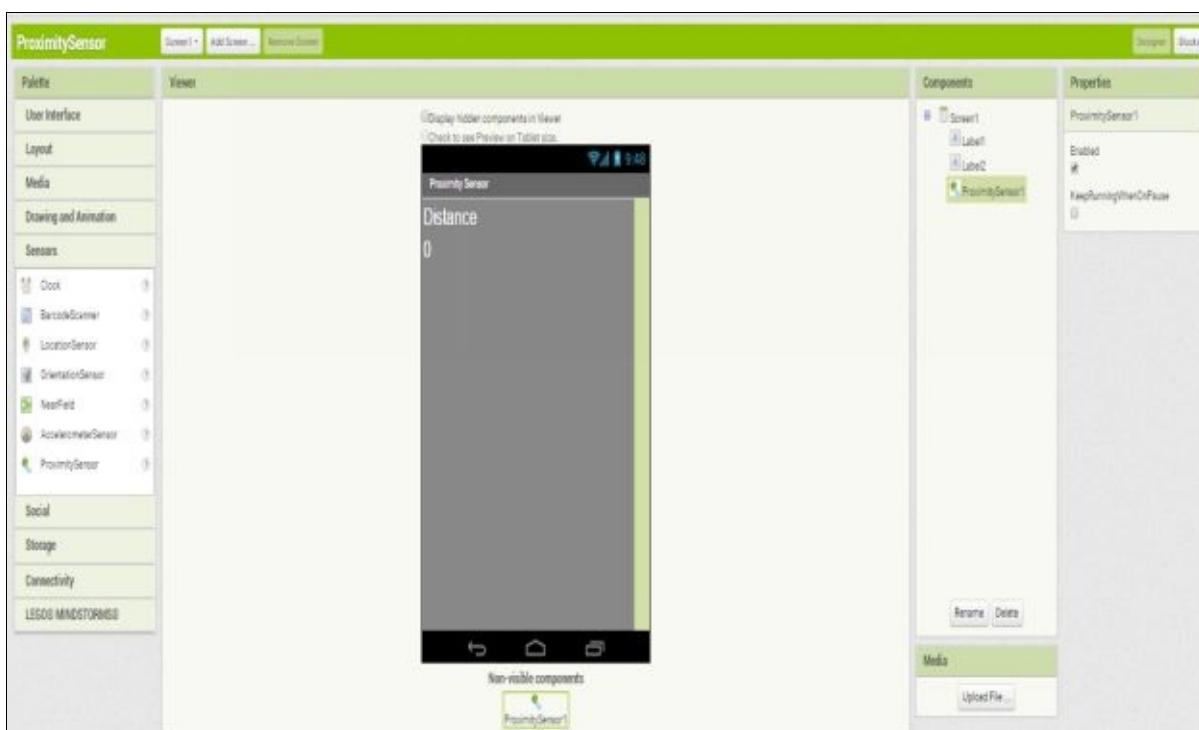

3. Drag a **Label** from **Palette** to **Viewer** screen and change its text to **Distance** and **FontSize** to **24** and **TextColor** to **White**.

4. Drag another **Label** from **Palette** to **Viewer** screen and change its **text** to **0** and **FontSize** to **24** and **TextColor** to **White**.

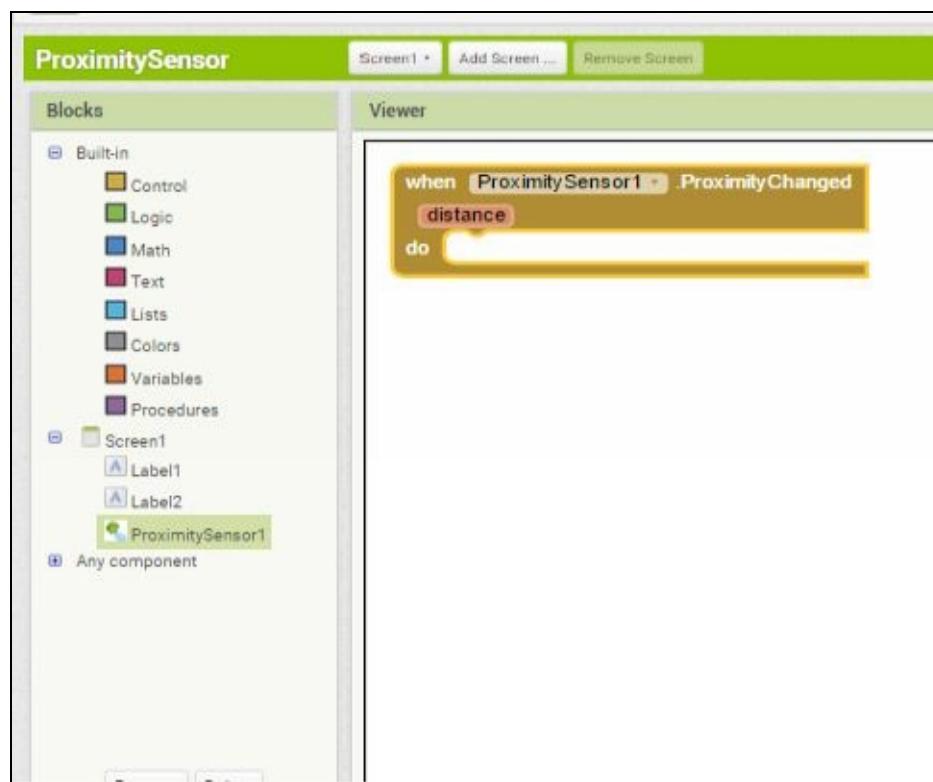

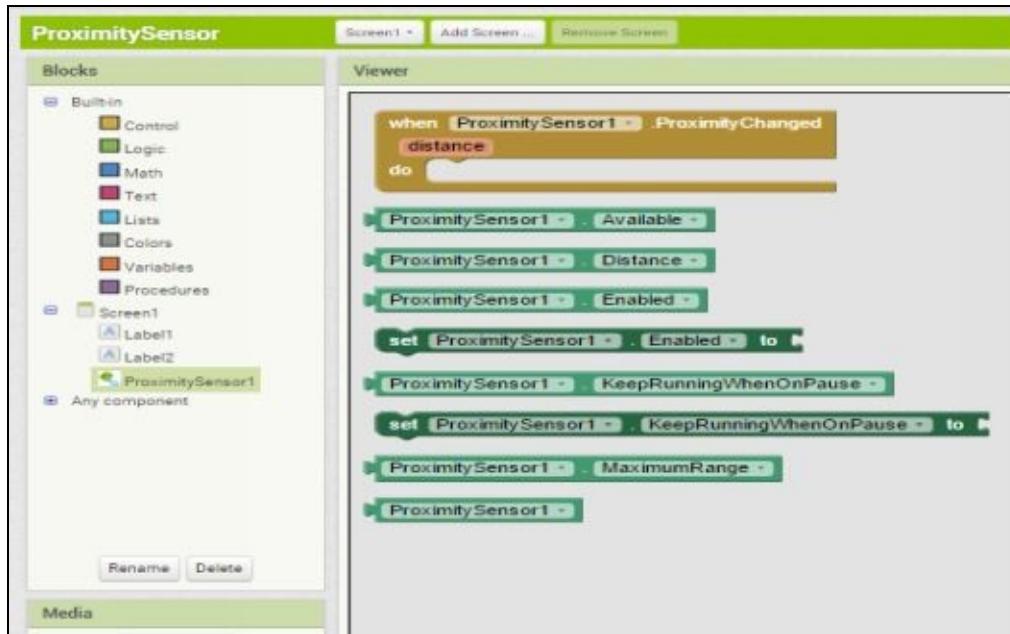

## 5. Drag a ProximitySensor (Non-visible) component from Palette to Viewer.

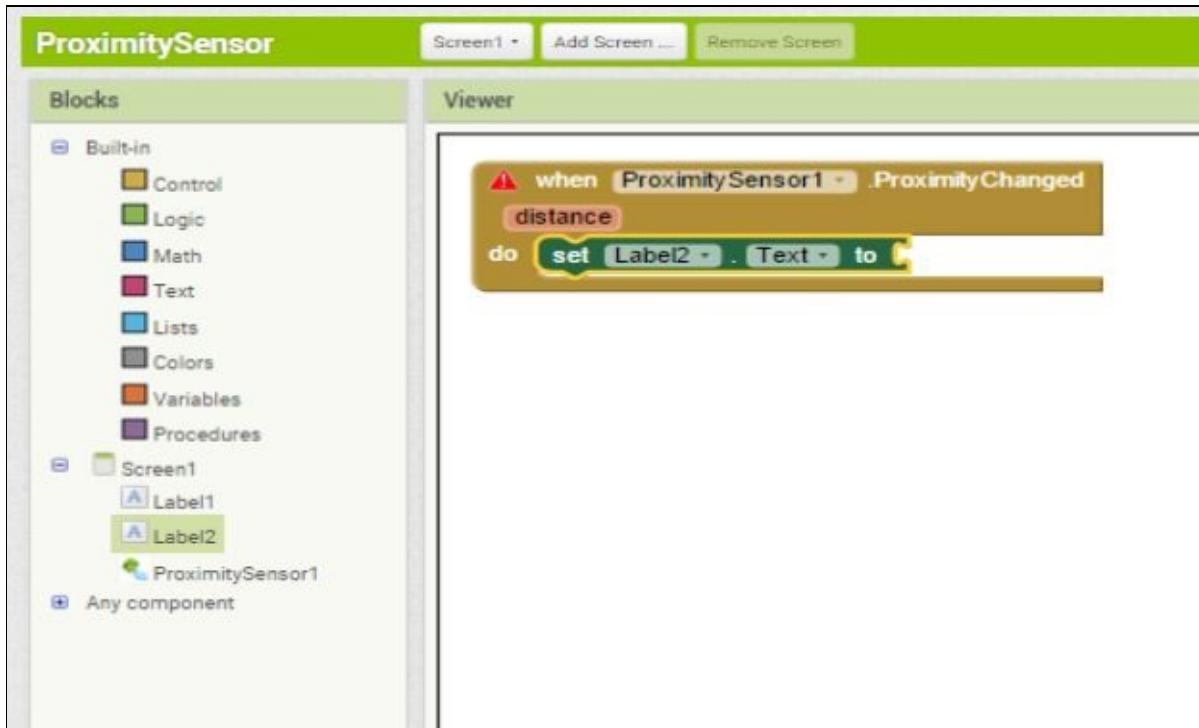

## 6. Go to Blocks and click on ProximitySensor1 and select block. This block will decide what to do when Proximity is changed.

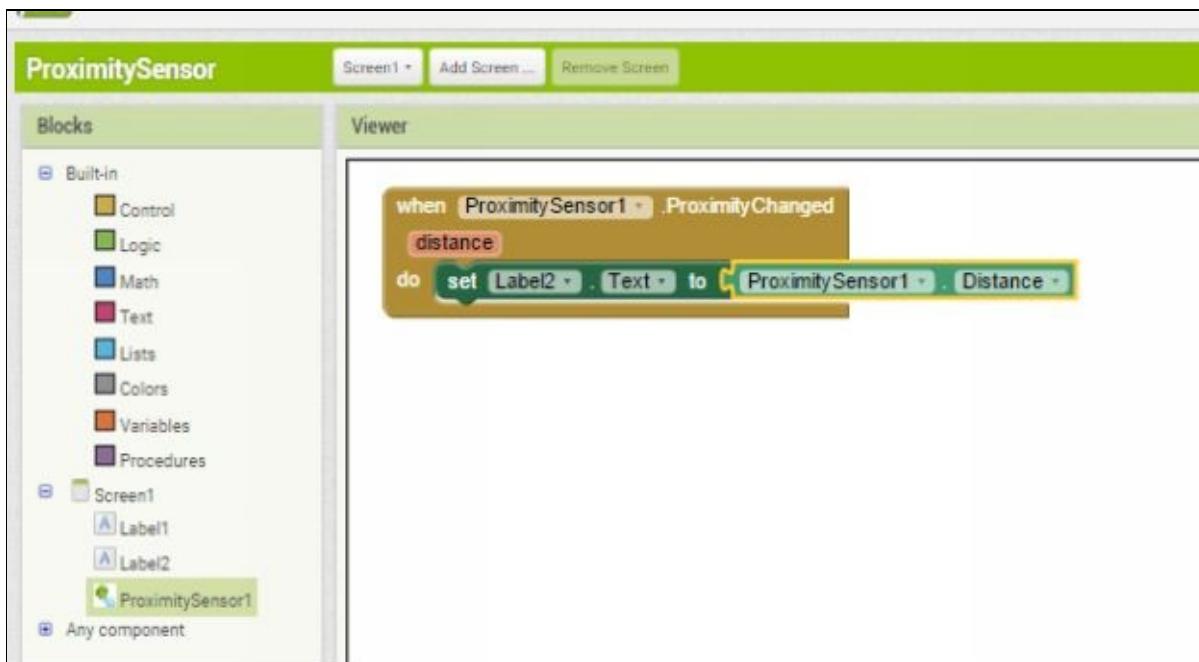

```
when ProximitySensor1 .ProximityChanged
  distance
  do [ ]
```

7. Click on **Label2** and select block.

8. Click on **ProximitySensor1** and select **ProximitySensor1 . Distance** block. This block will represent Proximity distance. Label2 will show the distance on your app screen.

9. Click on **Control** under **Built-in** and select **if** block. This is a conditional block. If given condition is true the it will choose some action to be performed and if condition is false/not true then it will execute else part.

    else [ ]
  end
end
  
```

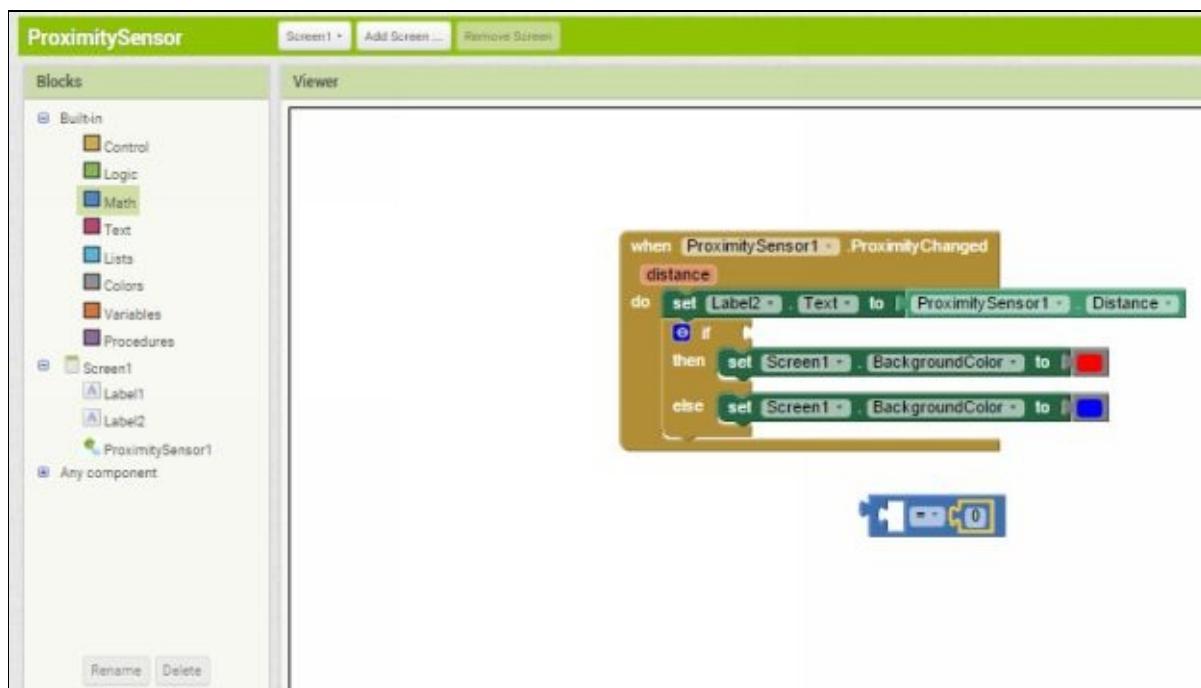

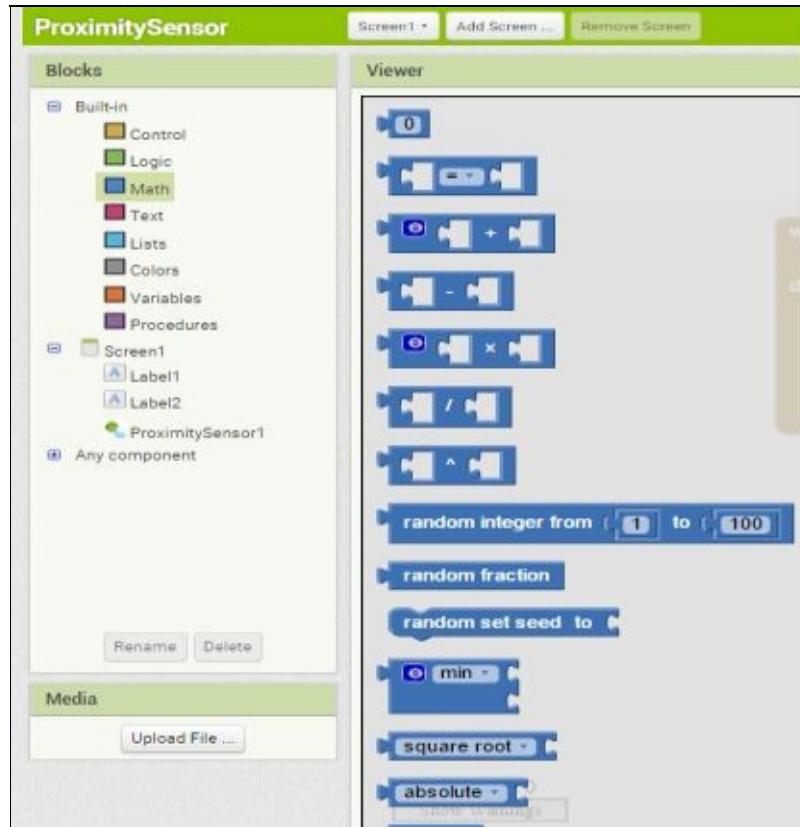

11. Click on **Screen1** and scroll down to select  block twice.

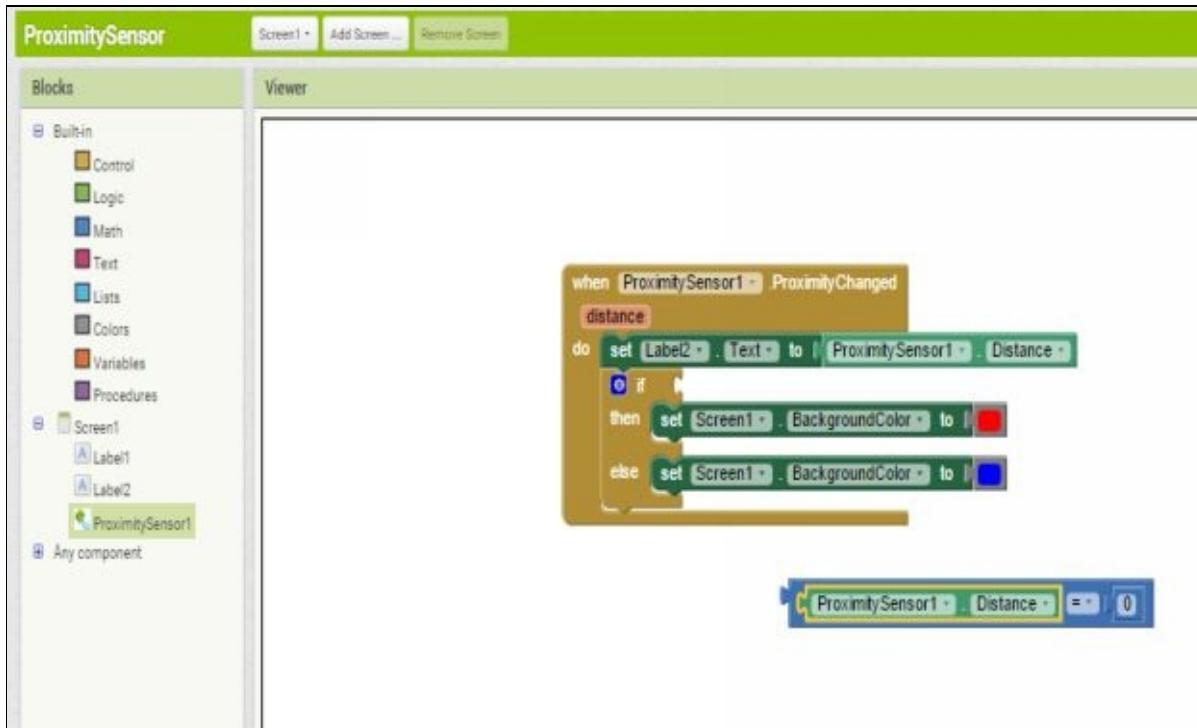

12. Click on **Colors** and select  blocks.

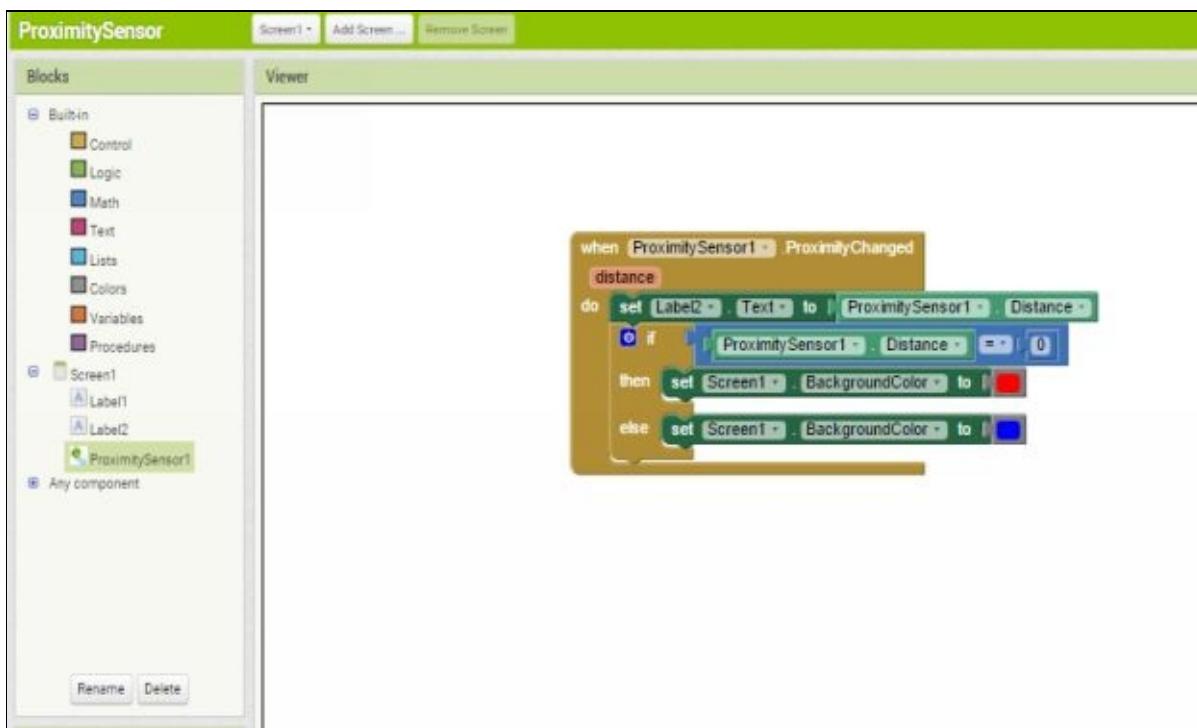

13. Click on **Math** under **Built-in** and select  blocks.

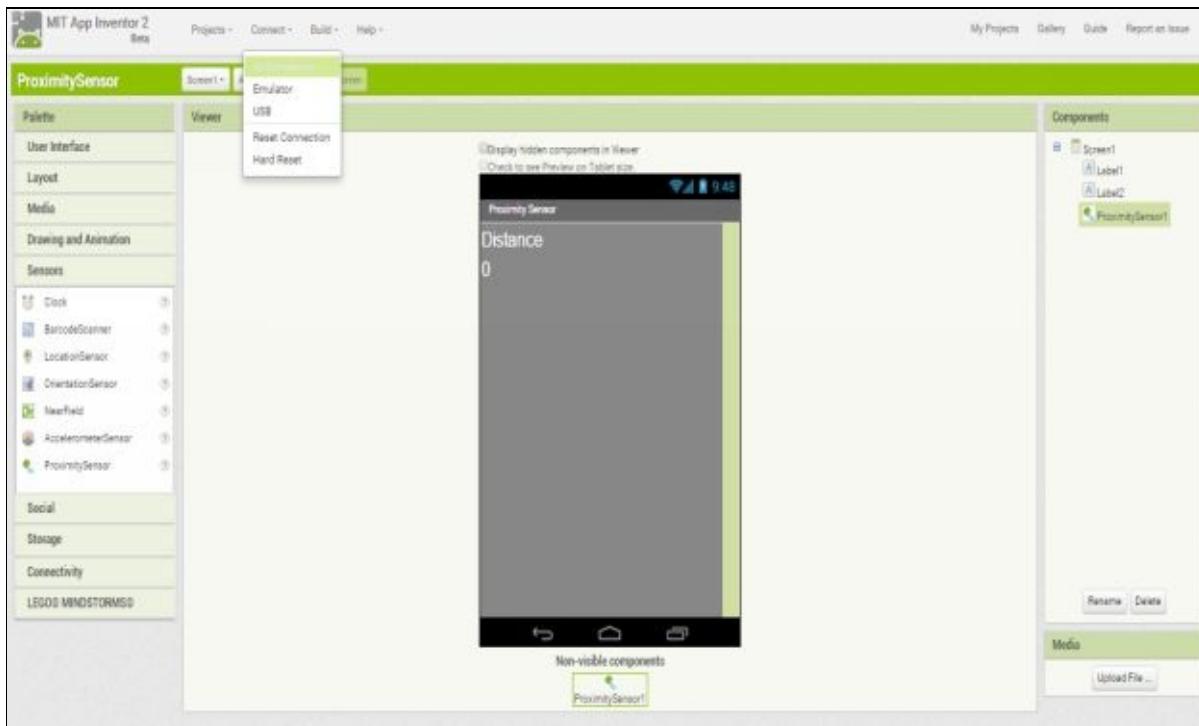

14. Click on **ProximitySensor1** and select **ProximitySensor1 . (Distance)** block.

15. Attach the **blocks** as shown below. So if Proximity distance is equal to 0 the app will change screen color to Red and if distance is not equal to 0 then else part will be executed i.e, screen color will be changed to Blue.

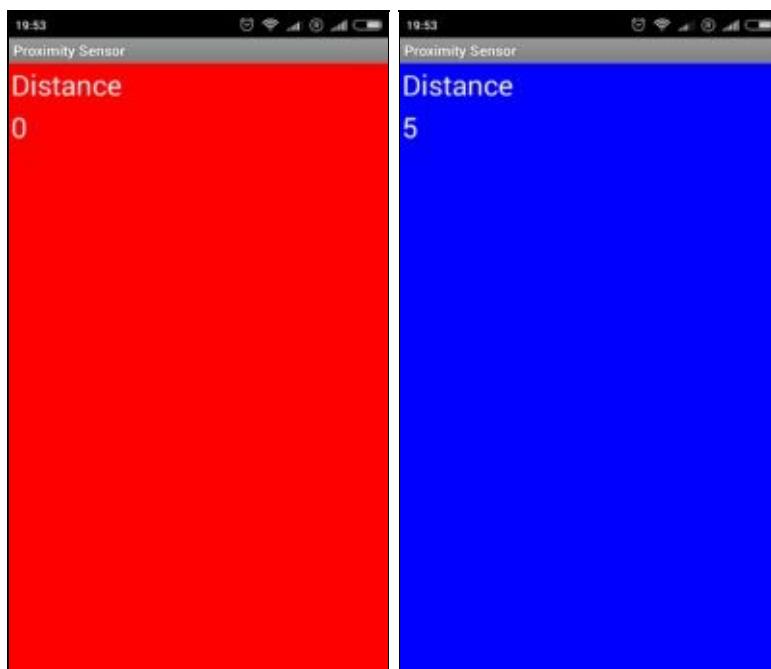

16. Go to **Designer** and click on **Connect** and then select **AI Companion**.

17. Now open **MIT App Inventor 2 Companion** in your mobile/Tablet. And enter the code or scan the **QR code** from your mobile and click on connect with code. Note:- Your Mobile/Tablet should be connected to same wi-fi/network to which your computer/Laptop is connected.

18. Now you should see your app in your phone for live testing. [Proximity sensor](#) is generally available on top of your phone. [Bring your hand near sensor and see the distance and color changing with changing Proximity.](#)

## Chapter 23 Image Picker app

1. Click on [Start new project](#) and give it name [Imagepicker](#) and click [OK](#).

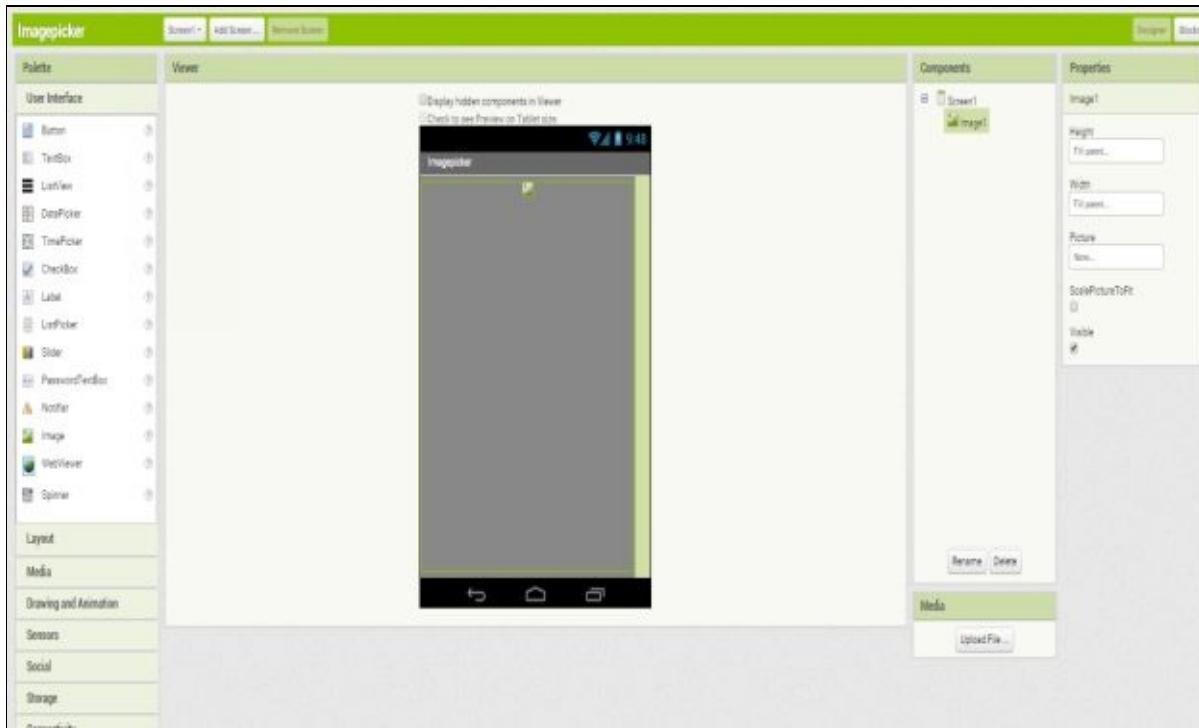

The screenshot shows the MIT App Inventor 2 interface. At the top, there's a navigation bar with 'MIT App Inventor 2 Beta', 'Projects', 'Connect', 'Build', and 'Help'. Below that is a green header bar with 'Start new project', 'Delete Project', and 'Publish to Gallery'. The main area is titled 'My Projects' and lists various projects with their names, dates created, and dates modified. A modal dialog box titled 'Create new App Inventor project' is open in the center, prompting for a 'Project name' (set to 'Imagepicker') with 'Cancel' and 'OK' buttons.

## 2. Change Screen1 Title to Imagepicker and BackgroundColor to Gray.

The screenshot shows the MIT App Inventor 2 Designer view for the 'Imagepicker' screen. The left sidebar contains a palette with categories like User Interface (containing Button, TextBox, ListView, etc.), Layout, Media, and Sensors. The central area shows the 'Viewer' with a preview of an Android device displaying the title 'Imagepicker' and a gray background. To the right is the 'Components' pane, which is currently empty. The 'Properties' pane on the far right shows settings for the screen, including 'Screen' (set to 'Imagepicker'), 'BackgroundColor' (set to 'gray'), and 'Title' (set to 'Imagepicker').

## 3. Drag an Image from Palette to Viewer screen and set its Height and Width to fill parent.

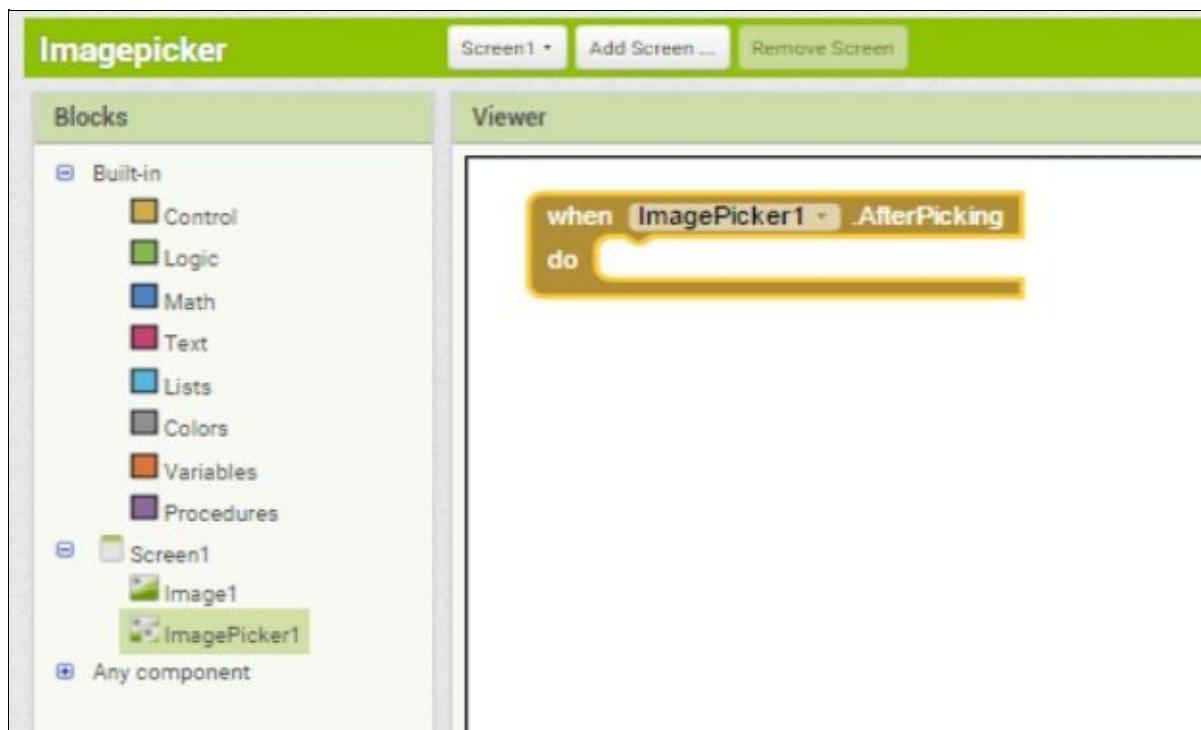

4. Drag an **ImagePicker** from Palette to **Viewer** screen and change its **Text** to **Select Image** and **FontSize** to **20.0**.

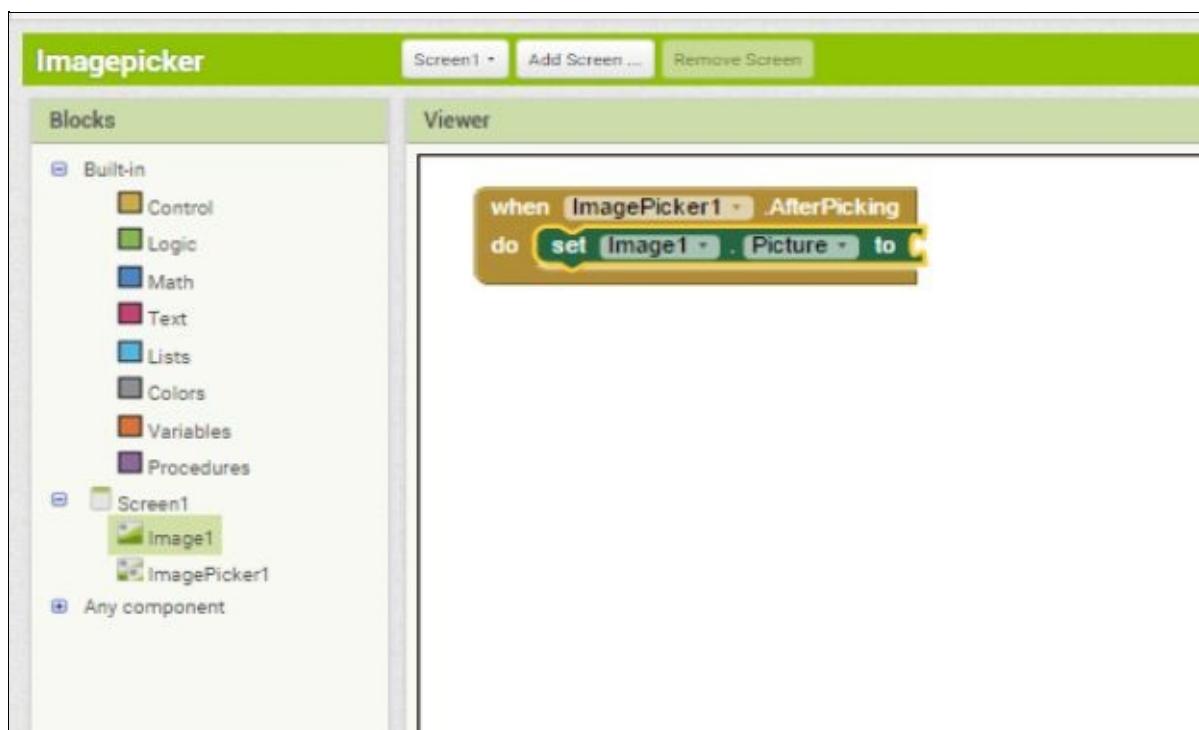

when **ImagePicker1** .AfterPicking  
do

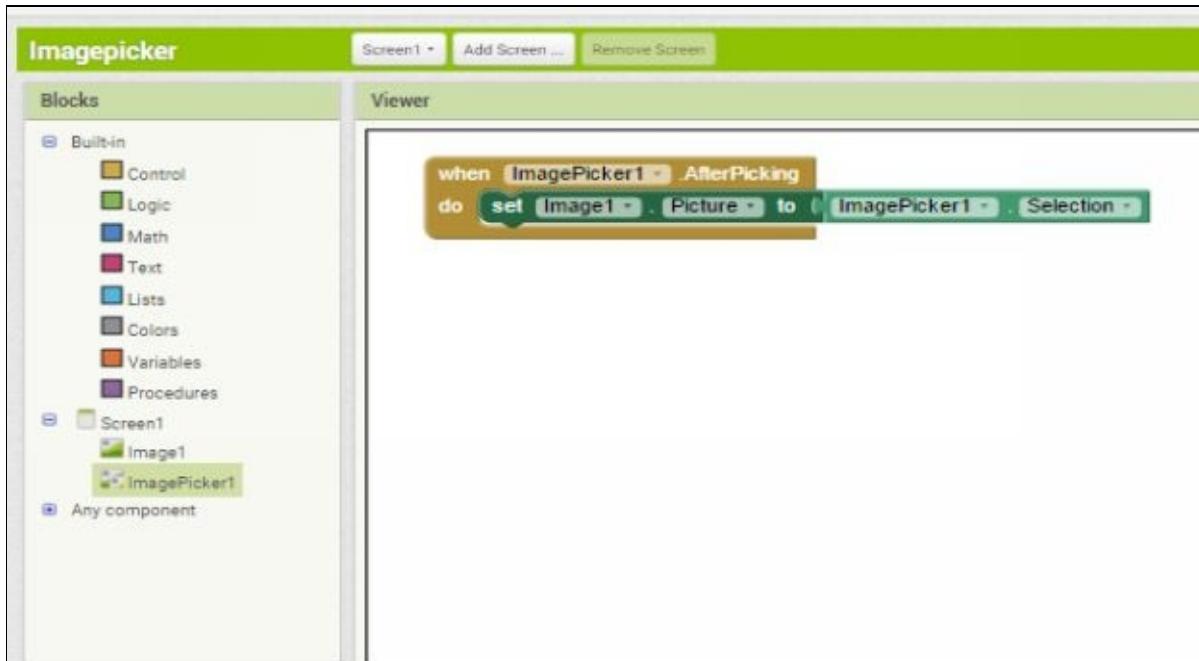

5. Go to **Blocks** and click on **ImagePicker1** and select **.AfterPicking** This block will open your phone's gallery and decide what to do with the selected image.

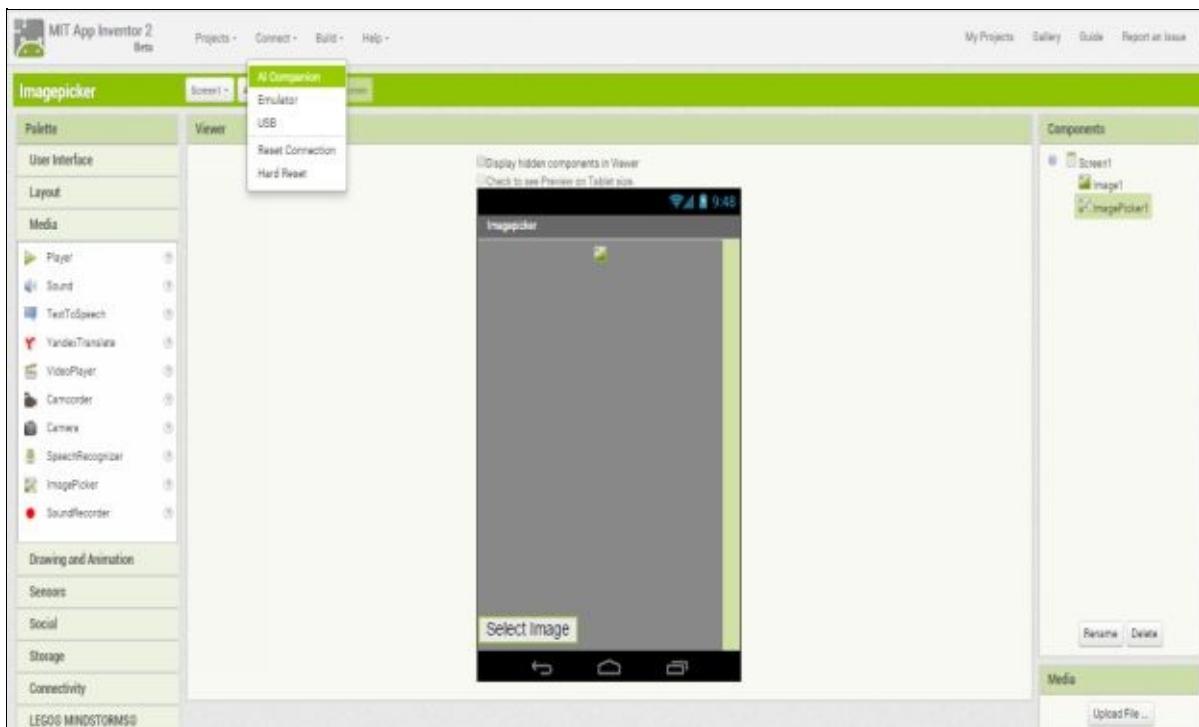

6. Click on **Image1** and select **set Image1 . Picture to [ ]** block. This block will set Image1's picture.

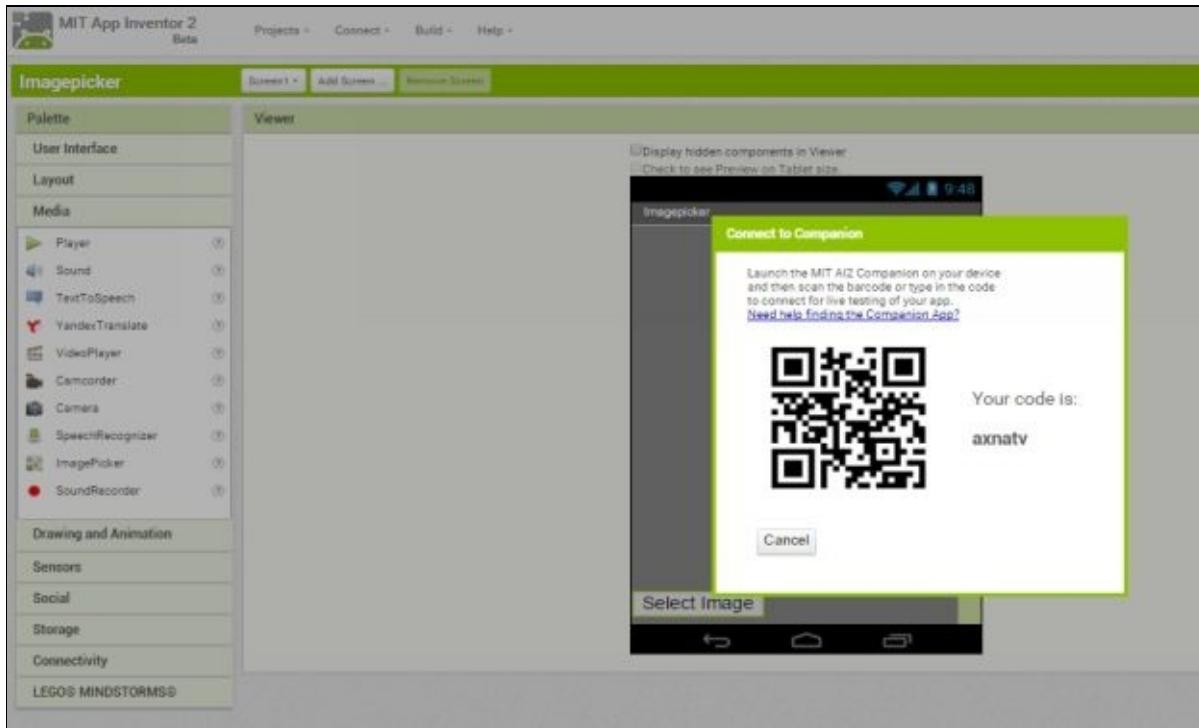

7. Click on **ImagePicker1** and scroll down to select **ImagePicker1 . Selection** block. This block will represent the selected image from gallery. So when you click ImagePicker1 , app will open Phone's gallery and you can choose an image and after picking the image it will be shown as Image1's image.

8. Go to Designer and click on Connect and select AI Companion.

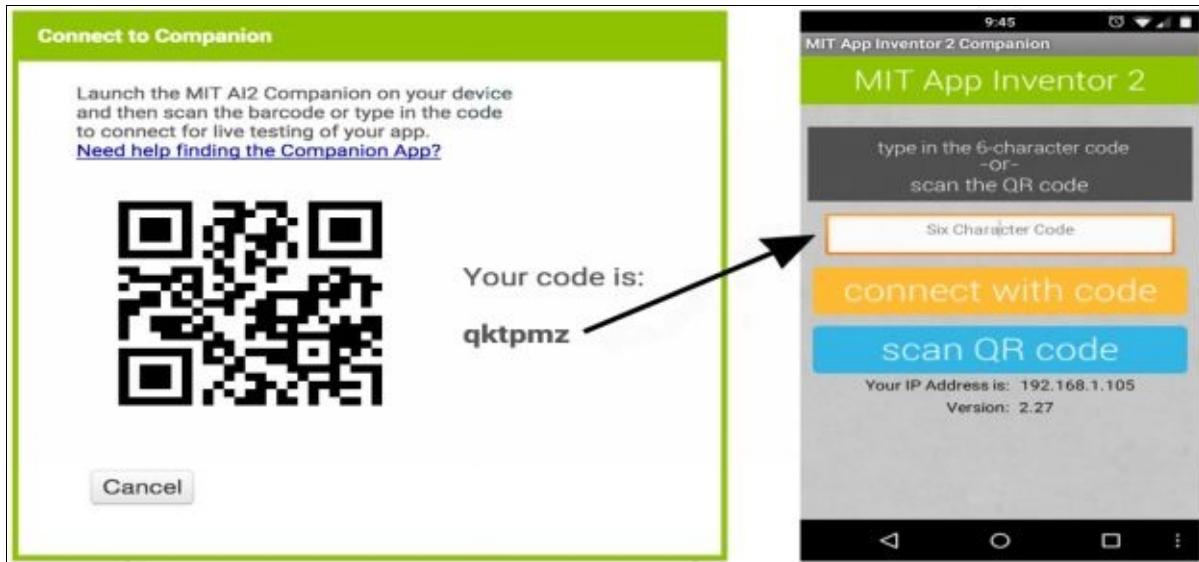

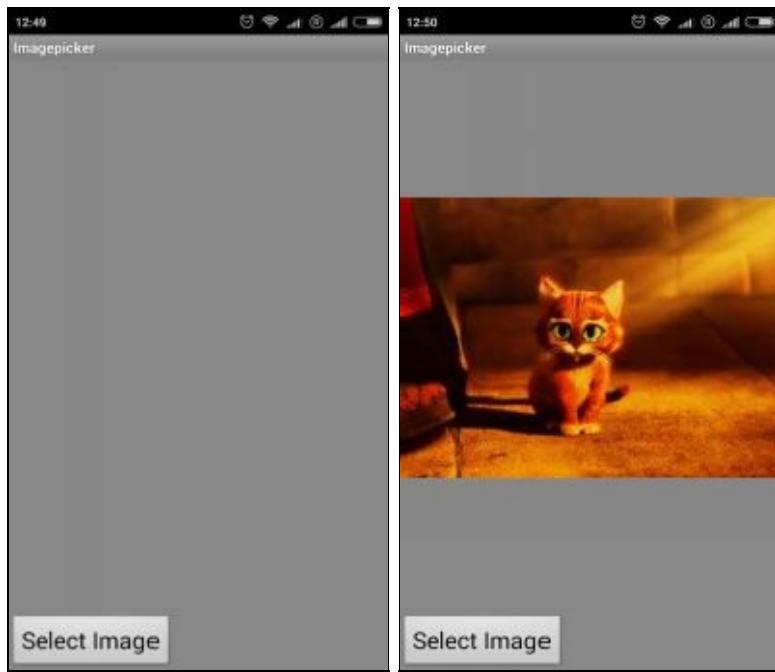

9. Now open MIT App Inventor 2 Companion in your mobile/Tablet.

And enter the code or scan the QR code from your mobile and click on connect with code.

Note:- Your Mobile/Tablet should be connected to same wi-fi/network to which your computer/Laptop is connected.

10. Now you should see your app in your phone for live testing. Click on Select Image Button to open Gallery and select Image from your phone.

## Chapter 24 Phone call app

1. Click on **Start new project** and give it name **Phonecall** and click **OK**.

Start new project Delete Project Publish to Gallery

Create new App Inventor project

Project name:

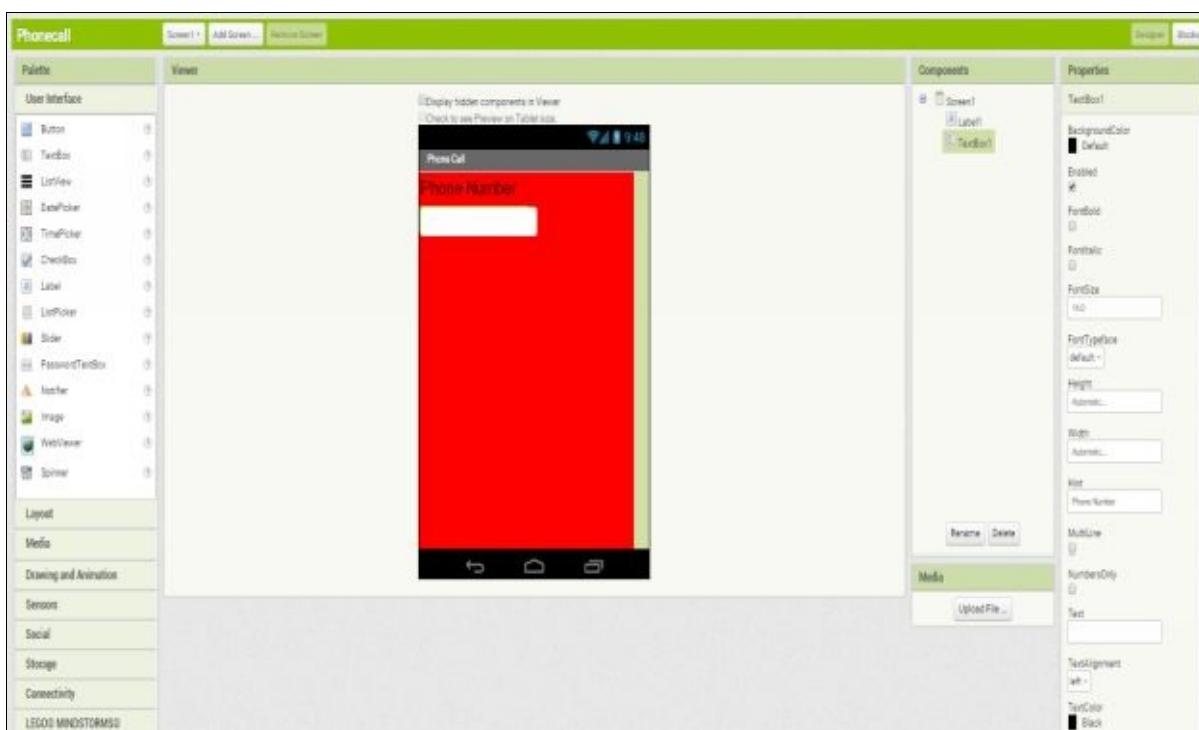

## 2. Change Screen1 Title to Phone Call and BackgroundColor to Red.

The screenshot shows the App Inventor Designer interface for the "Phonecall" project. The top navigation bar includes "Phonecall", "Screen1", "Add Screen...", "Delete Screen...", "Designer", and "Blocks". The left sidebar, titled "Palette", lists categories like User Interface, Layout, Media, Drawing and Animation, Sensors, Social, Storage, Connectivity, and LEGOS MINDSTORMS®. Under the Social category, components like EmailPicker, Texting, PhoneNumberPicker, PhoneCall, Sharing, Twitter, and ContactPicker are listed. The central "Viewer" area displays a smartphone screen with a red background labeled "Phone Call". The bottom right "Components" and "Properties" panels are visible, showing "Screen1" selected in the Components list. The Properties panel shows the following settings: Name = "Phonecall", BackgroundColor = "Red", and Title = "Phone Call".

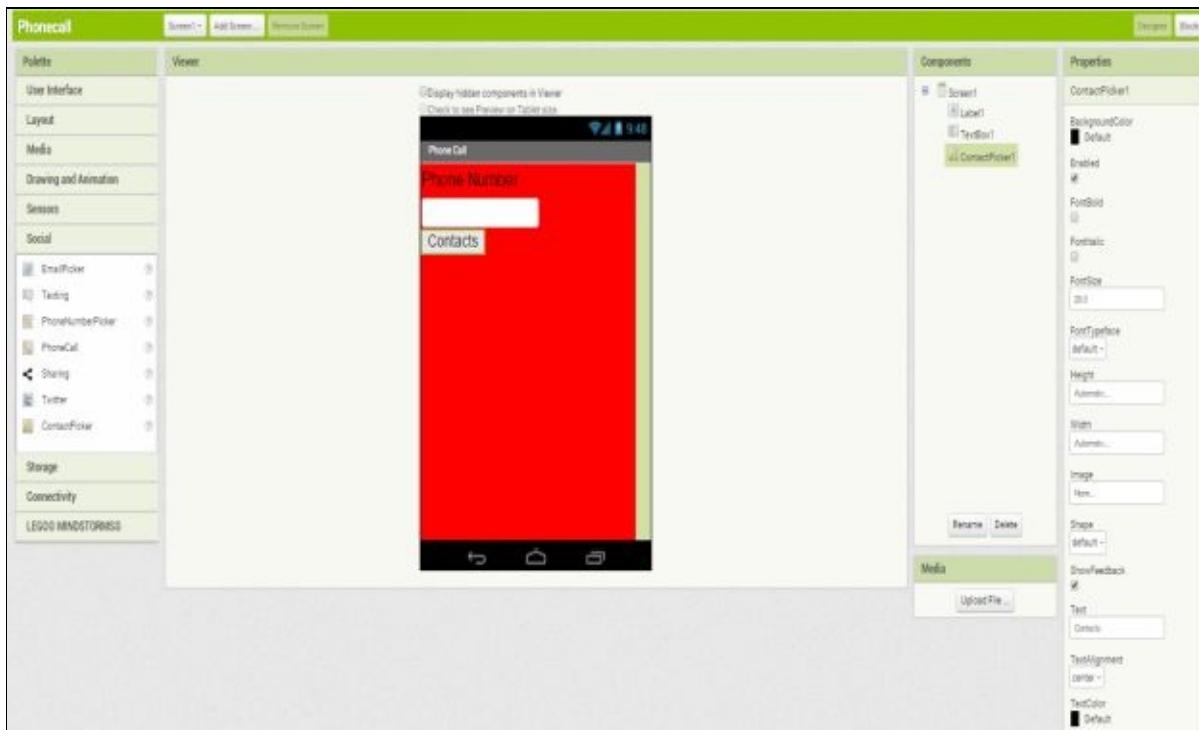

## 3. Drag a Label from Palette to Viewer screen and change its Text to Phone Number and FontSize to 20.0.

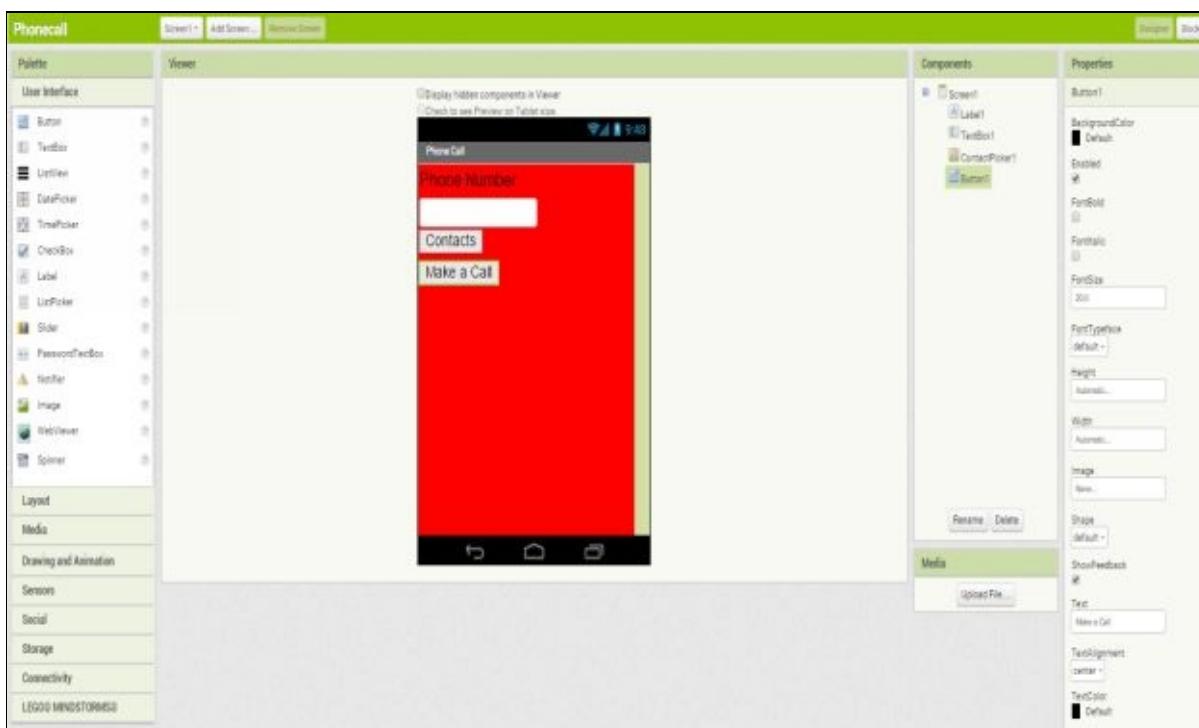

#### 4. Drag a **TextBox** from **Palette** to **Viewer** screen and Change its **Hint** to **Phone Number**.

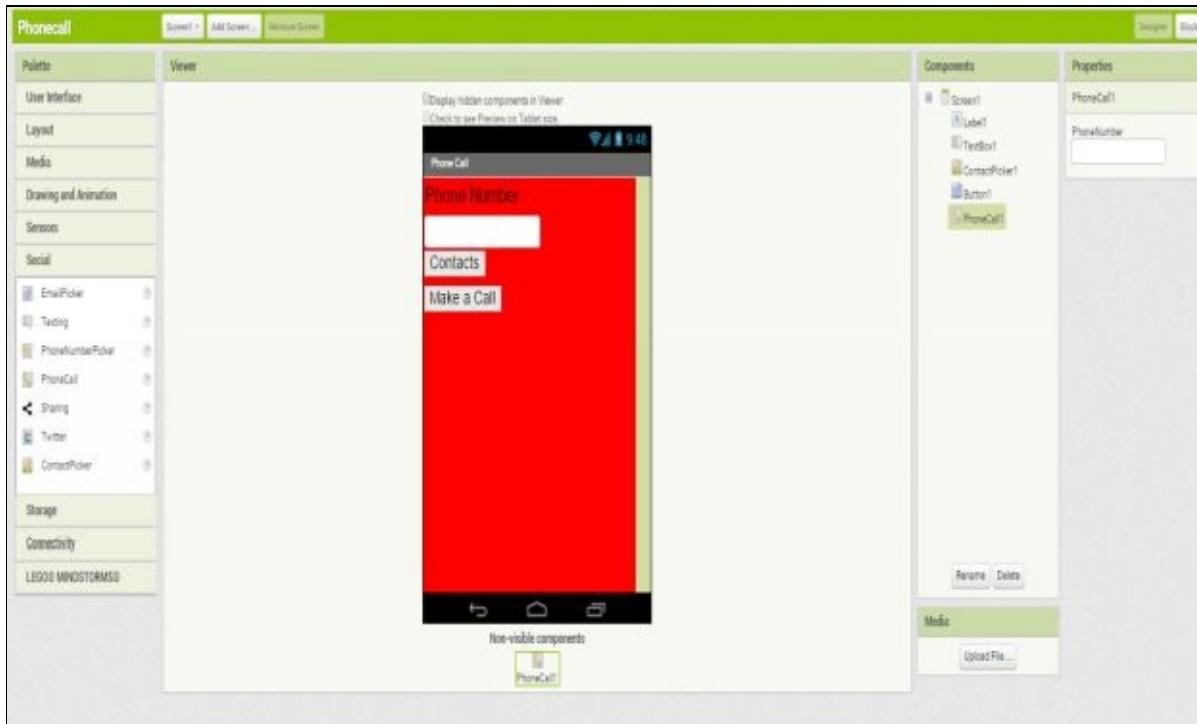

#### 5. Drag a **ContactPicker** from **Palette** to **Viewer** screen and Change its **Text** to **Contacts** and **FontSize** to **20.0**.

6. Drag a **Button** from **Palette** to **Viewer** screen and Change it's **Text** to **Make a Call** and **FontSize** to **20.0**.

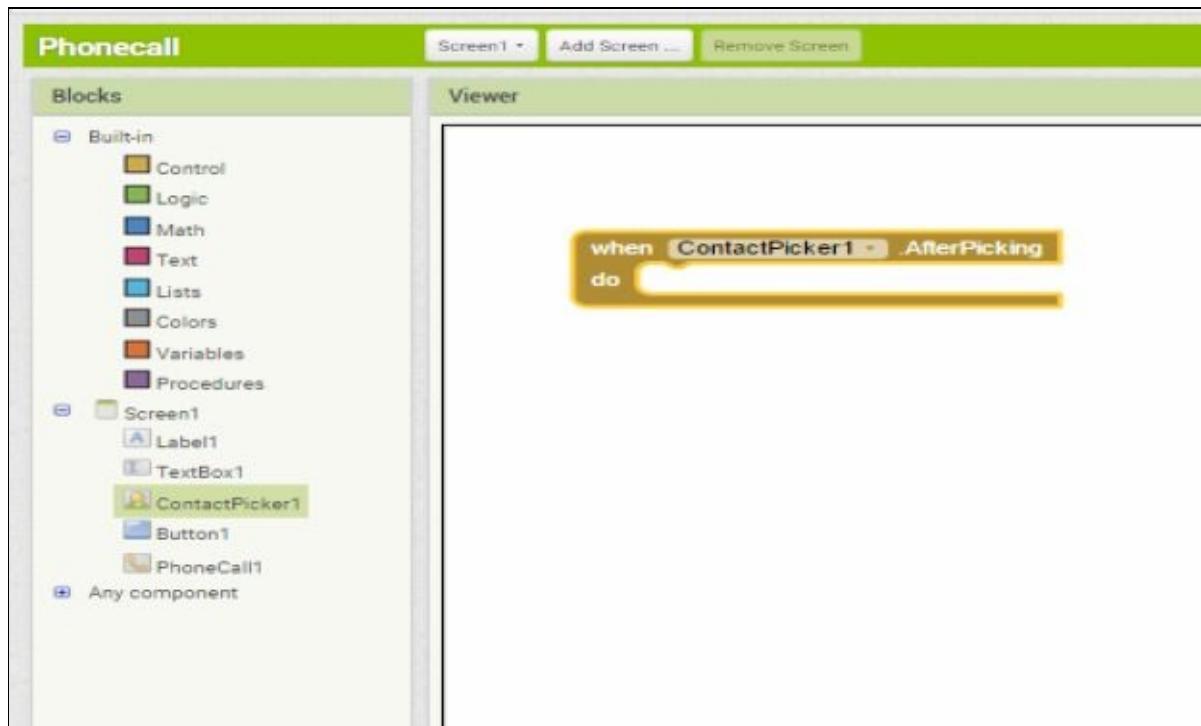

7. Drag a **PhoneCall** (Non-visible) component from **Palette** to **Viewer**.

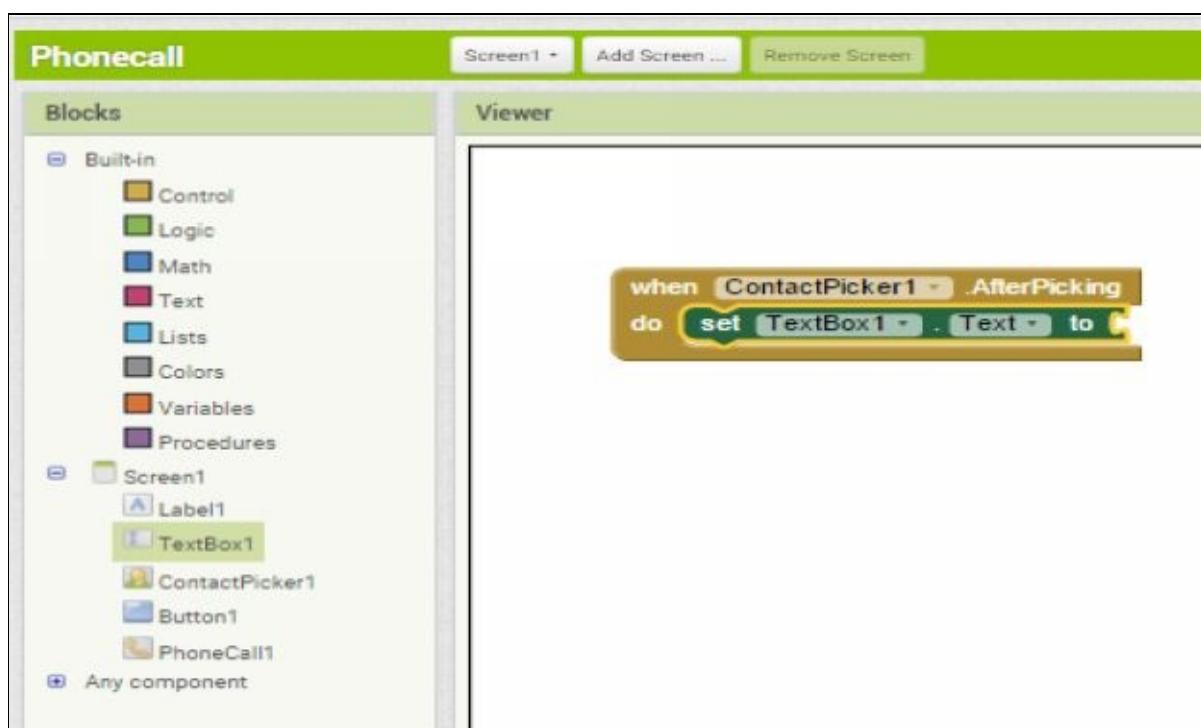

8. Go to **Blocks** and click on **ContactPicker1** and select  block.  
This block will Open your phone's contact list and decide what to do after you select a contact.

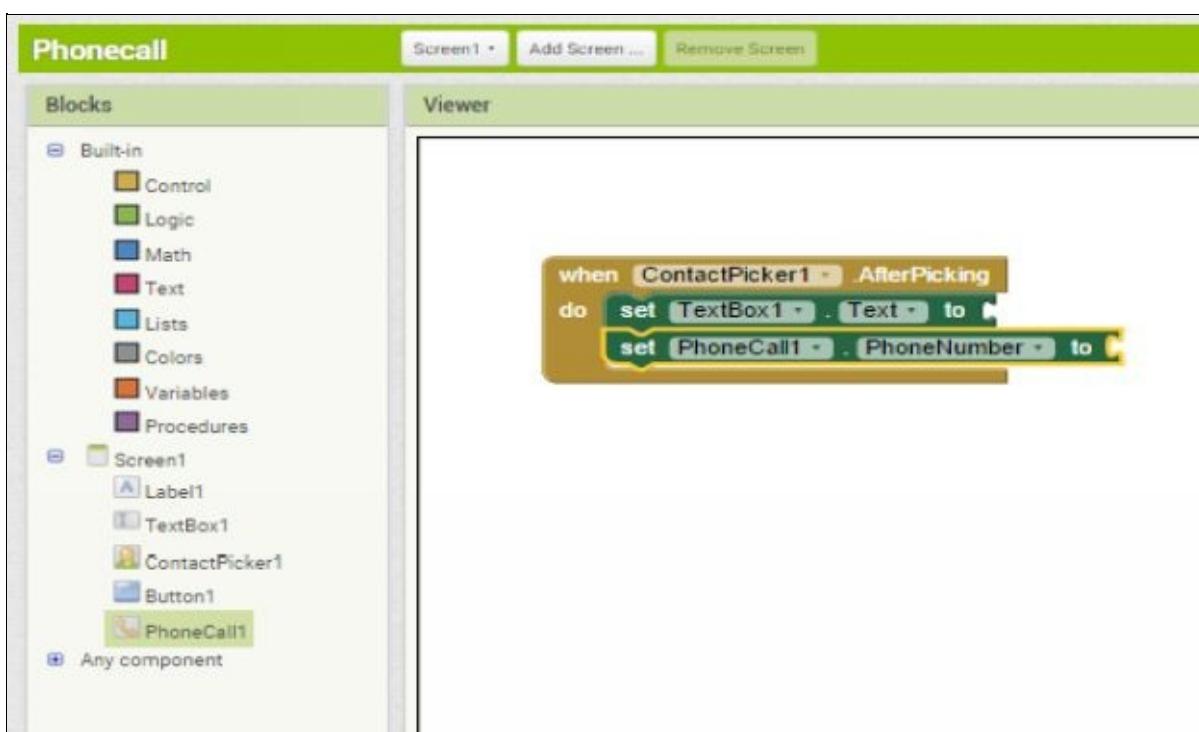

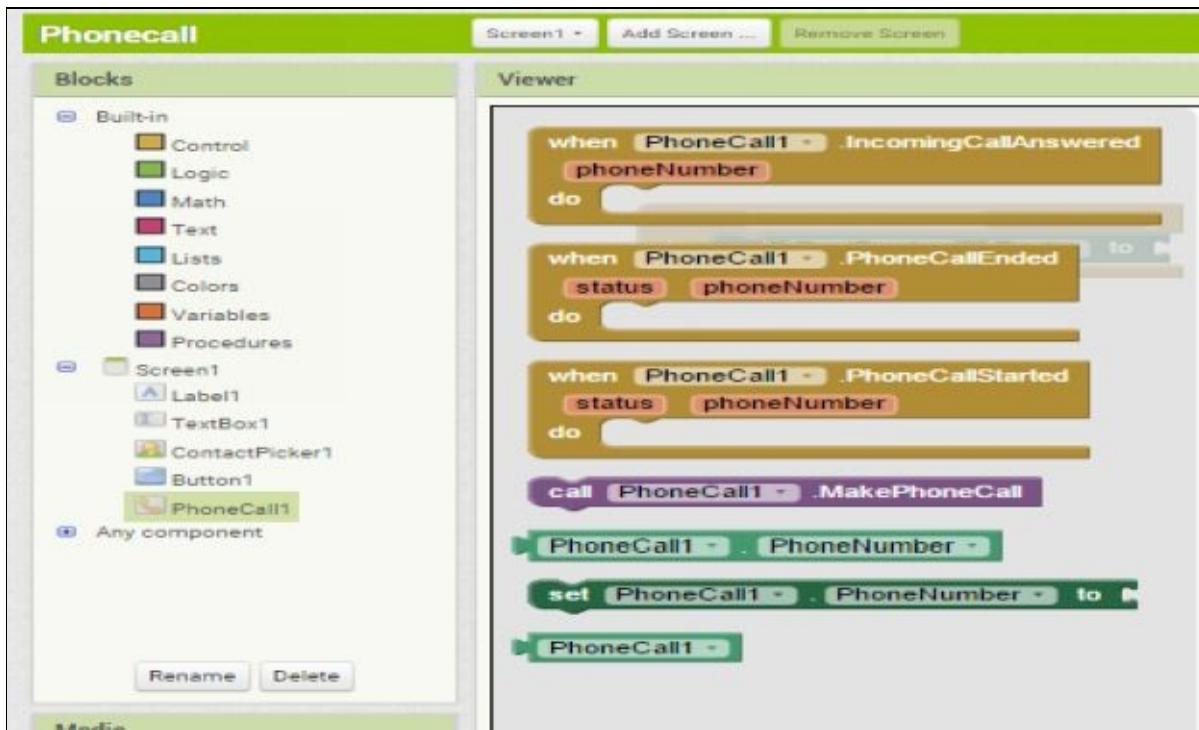

9. Click on **TextBox1** and scroll down to select **set [TextBox1 v]. Text v to [ ]** block.

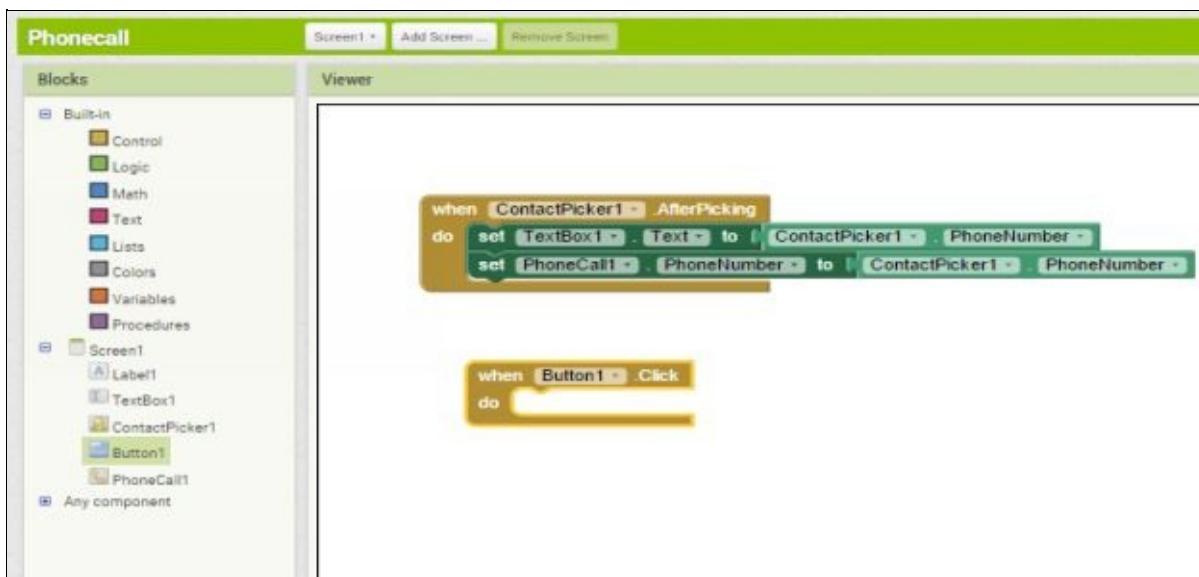

10. Click on **PhoneCall1** and select **set [PhoneCall1 v]. PhoneNumber v to [ ]** block. This block will set the Phone Number for PhoneCall.

11. Click on **ContactPicker1** and scroll down to select **ContactPicker1 . PhoneNumber** block twice. This block will represent Phone Number of selected contact from Phone's Contact list. So after picking the contact, app will show the Phone number in TextBox1 and also set the Phone Number for PhoneCall.

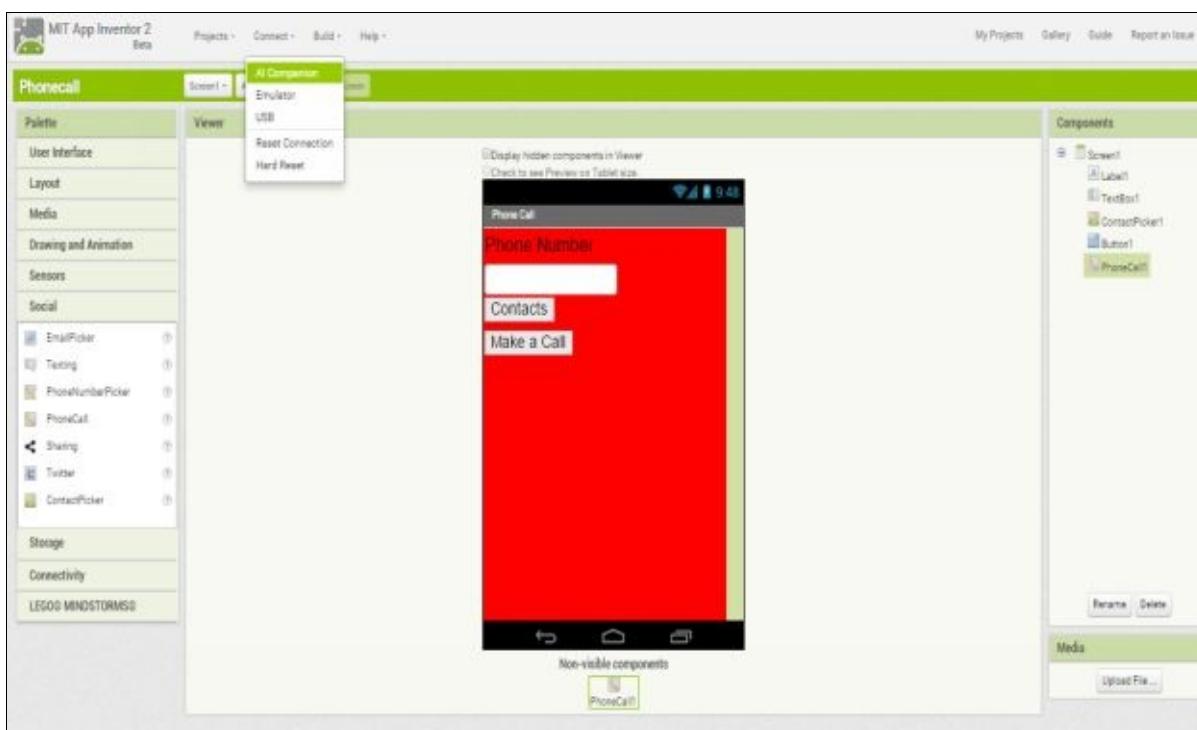

12. Click on **Button1** and select **when [Button1] .Click** block. This is an event block which will decide what your app will do when this button will be clicked. Here click is an event for Button1 component.

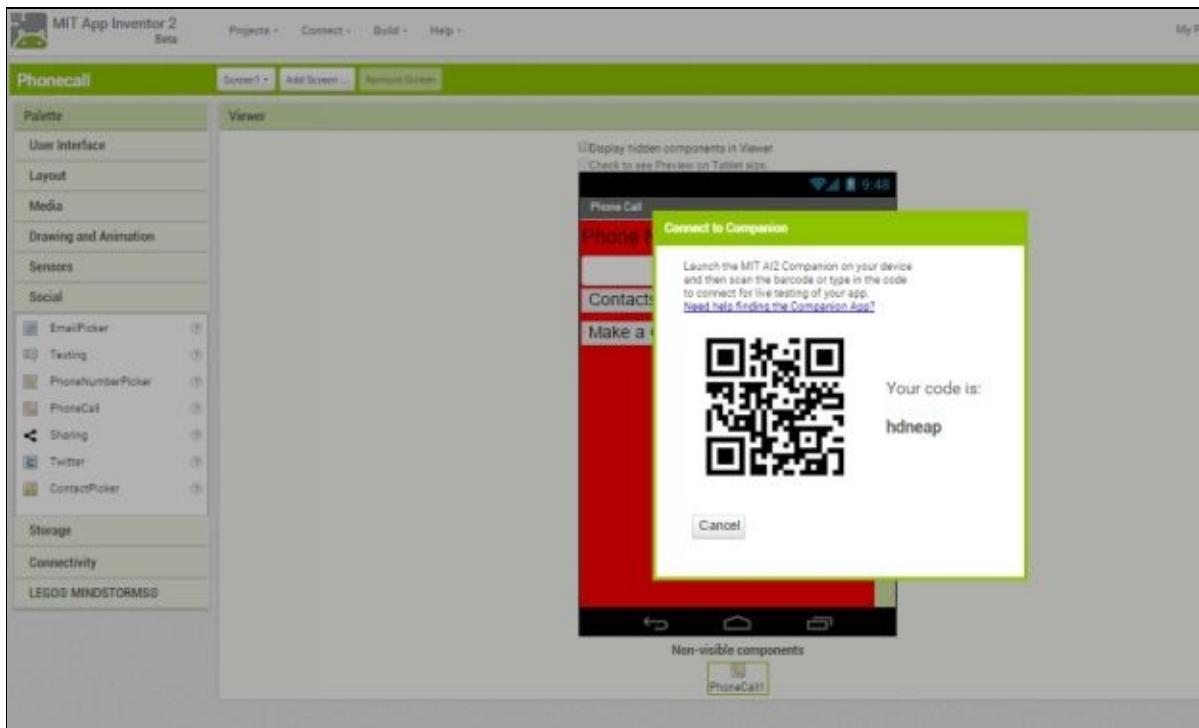

13. Click on **PhoneCall1** and select **call [PhoneCall1] .MakePhoneCall** block. This block will make a call to selected Phone Number.

14. Go to Designer and Click on Connect then select AI Companion.

15. Now open MIT App Inventor 2 Companion in your mobile/Tablet.

And enter the code or scan the [QR code](#) from your mobile and click on connect with code.

Note:-Your Mobile/Tablet should be connected to same wifi/network to which your computer/Laptop is connected.

16. Now you should see your app in your phone for live testing. [Click on Contacts Button to select a Phone number from your phone contacts and then click on Make a Call Button to call that phone number.](#)

## Chapter 25 Flash Bird app

1. Click on **Start new project** and give it name **FlashBird** and click **OK**.

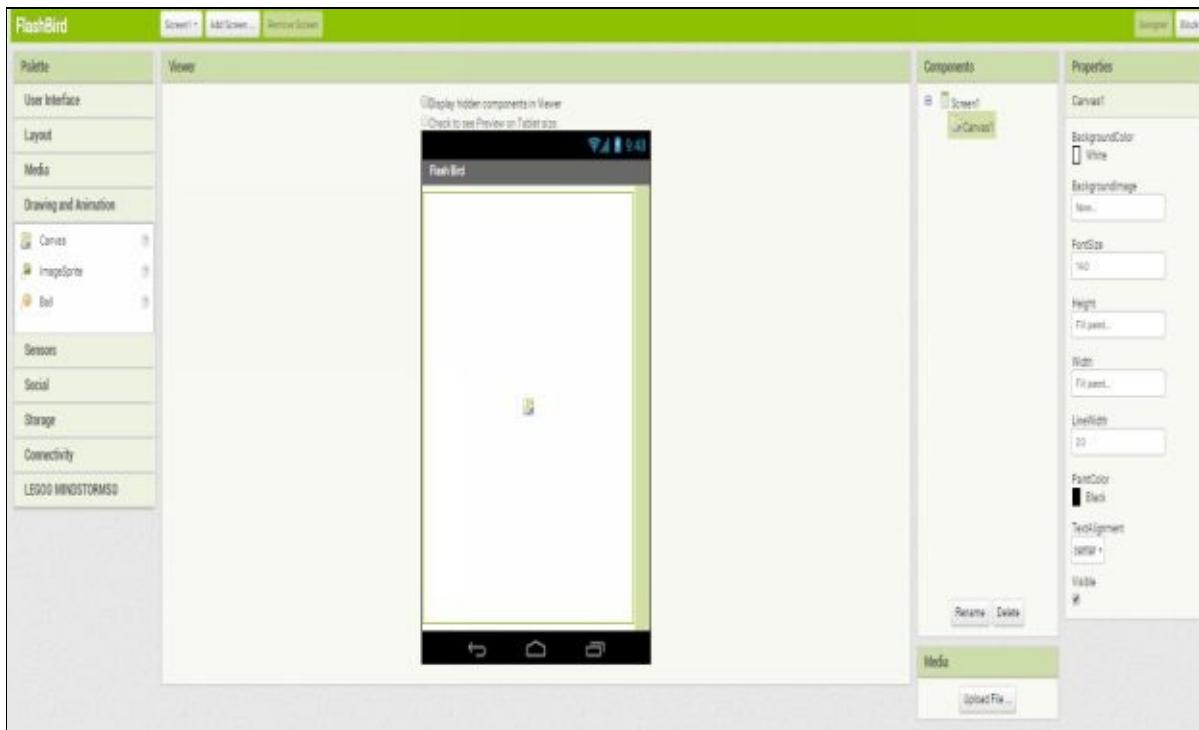

The screenshot shows the MIT App Inventor 2 Beta interface. At the top, there are navigation links: 'Start new project', 'Select Project', 'Publish to Gallery', 'My Projects', 'Gallery', 'Guide', and 'Report an issue'. Below this is a section titled 'My Projects' containing a list of existing projects. A modal dialog box titled 'Create new App Inventor project' is open in the center, prompting for a 'Project name' (set to 'FlashBird') and providing 'Cancel' and 'OK' buttons.

Name	Date Created	Date Modified
Phonecall	Jan 29, 2016, 1:08:22 PM	Jan 29, 2016, 3:29:12 PM
Imagepicker	Jan 29, 2016, 12:31:24 PM	Jan 29, 2016, 1:05:07 PM
ProximitySensor	Jan 27, 2016, 7:15:41 PM	Jan 29, 2016, 11:57:52 AM
Photoshare	Jan 27, 2016, 5:19:26 PM	Jan 27, 2016, 5:19:26 PM

DrawObject	Jan 2, 2016, 12:08:29 PM	Jan 2, 2016, 12:32:52 PM
Kitten_new	Jan 1, 2016, 12:13:27 PM	Jan 1, 2016, 5:59:48 PM

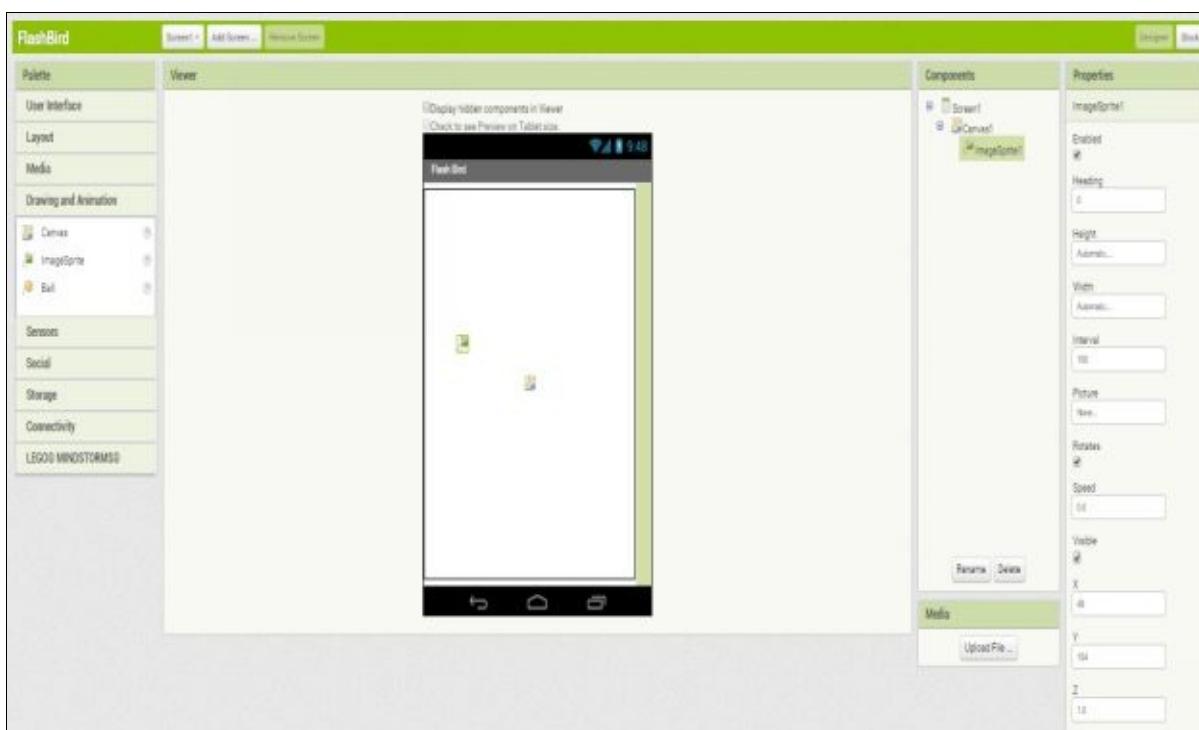

## 2. Change Screen1 Title to Flash Bird.

The screenshot shows the MIT App Inventor 2 Designer screen for the 'FlashBird' project. The interface includes a 'Palette' on the left with categories like User Interface, Layout, Media, Drawing and Animation, Sensors, Social, Storage, and Connectivity. The 'Viewer' in the center displays a mobile phone screen with the title 'Flash Bird'. The 'Components' and 'Properties' panes on the right show details for 'Screen1', including its title 'AboutScreen' and various styling options like background color and orientation.

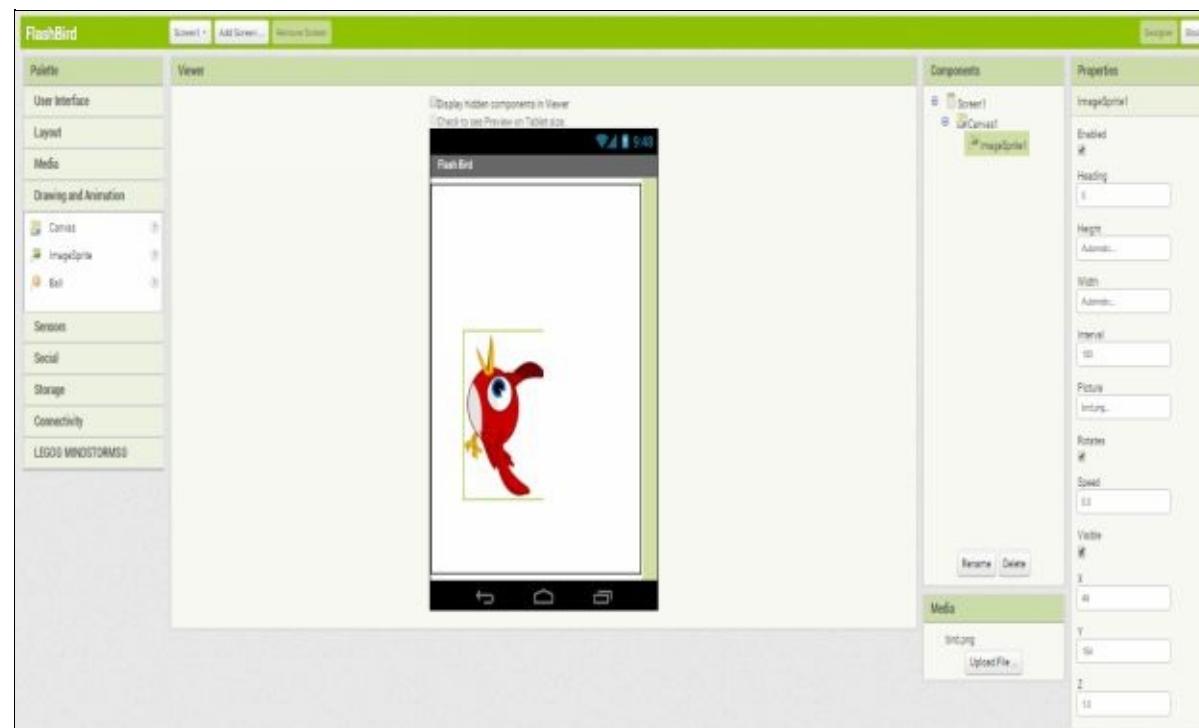

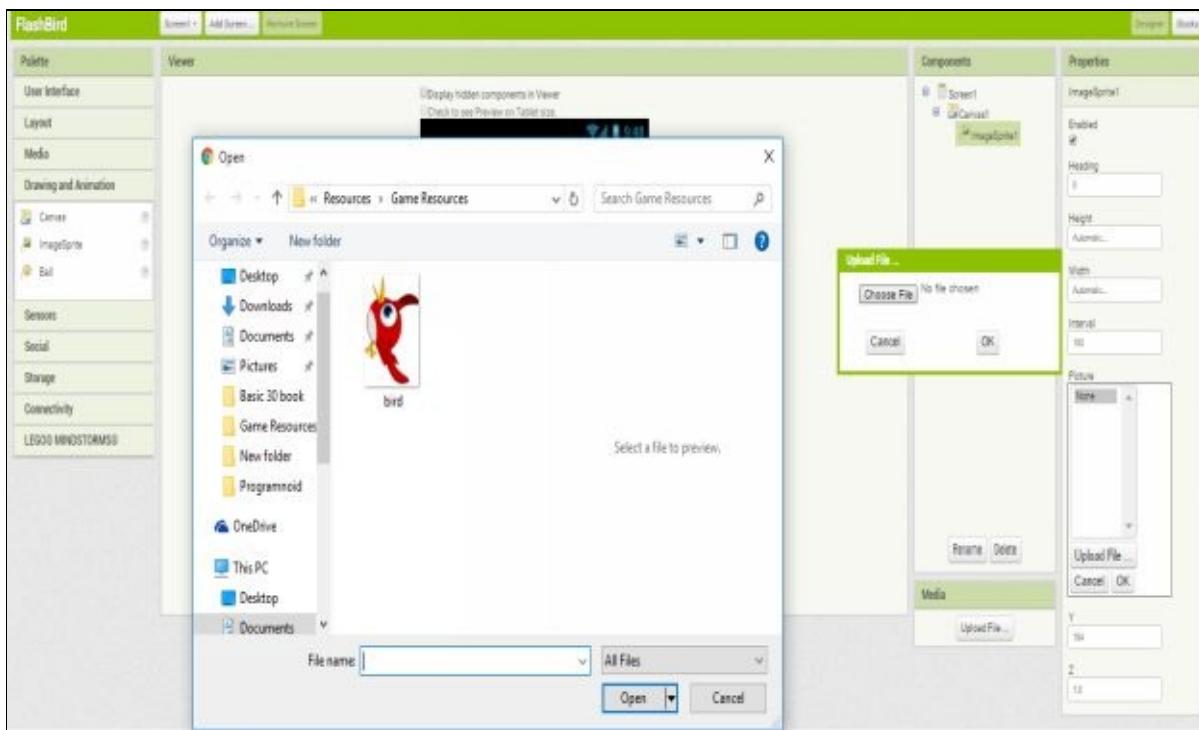

## 3. Drag a Canvas from Palette to Viewer screen and Change its Height and Width both to Fill parent.

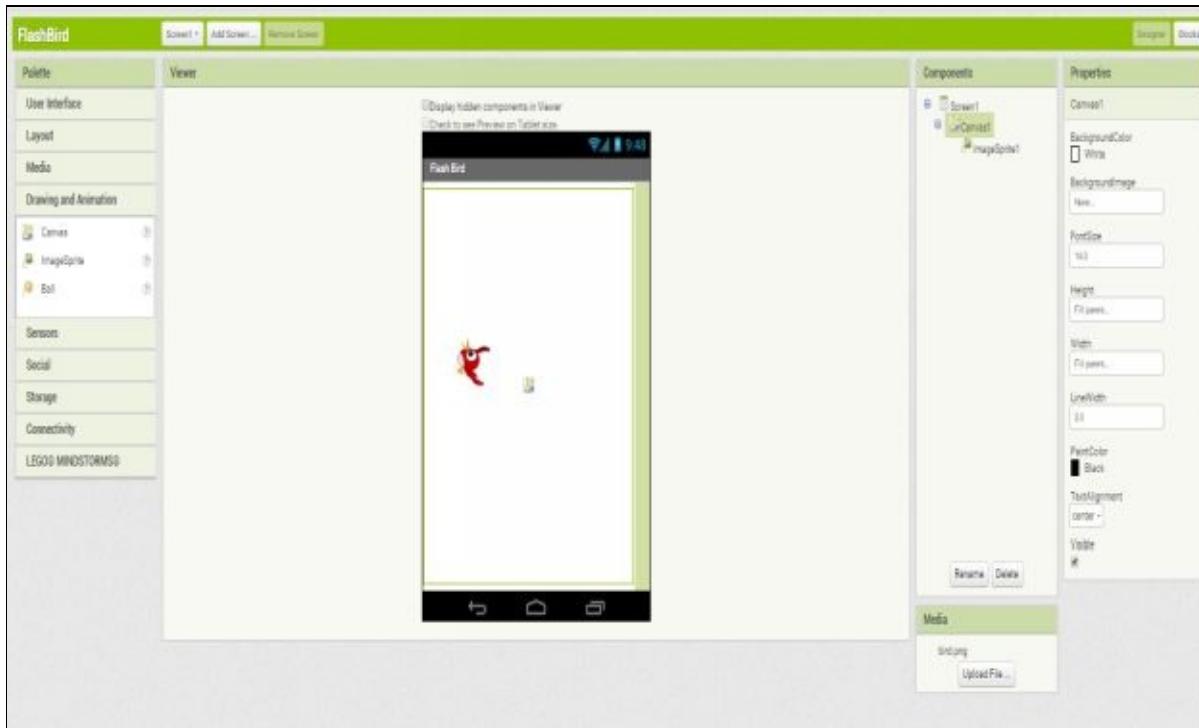

#### 4. Drag an ImageSprite from Palette to Viewer.

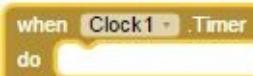

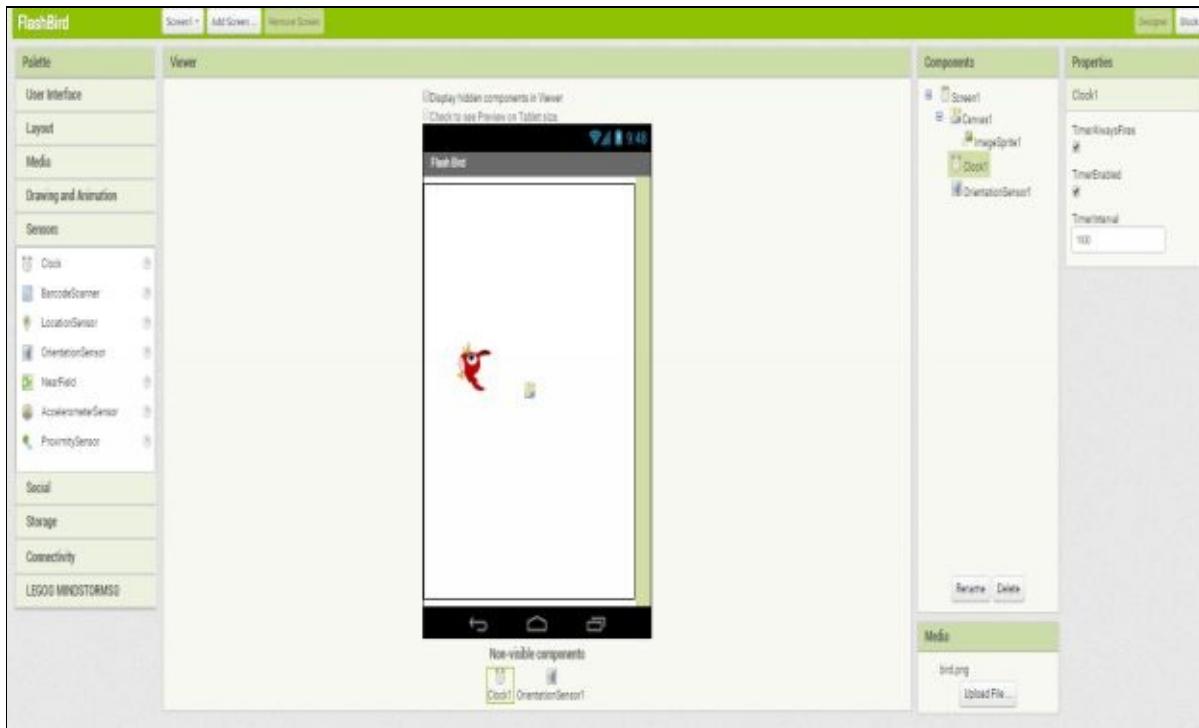

#### 5. Change ImageSprite1's Picture to bird.png.

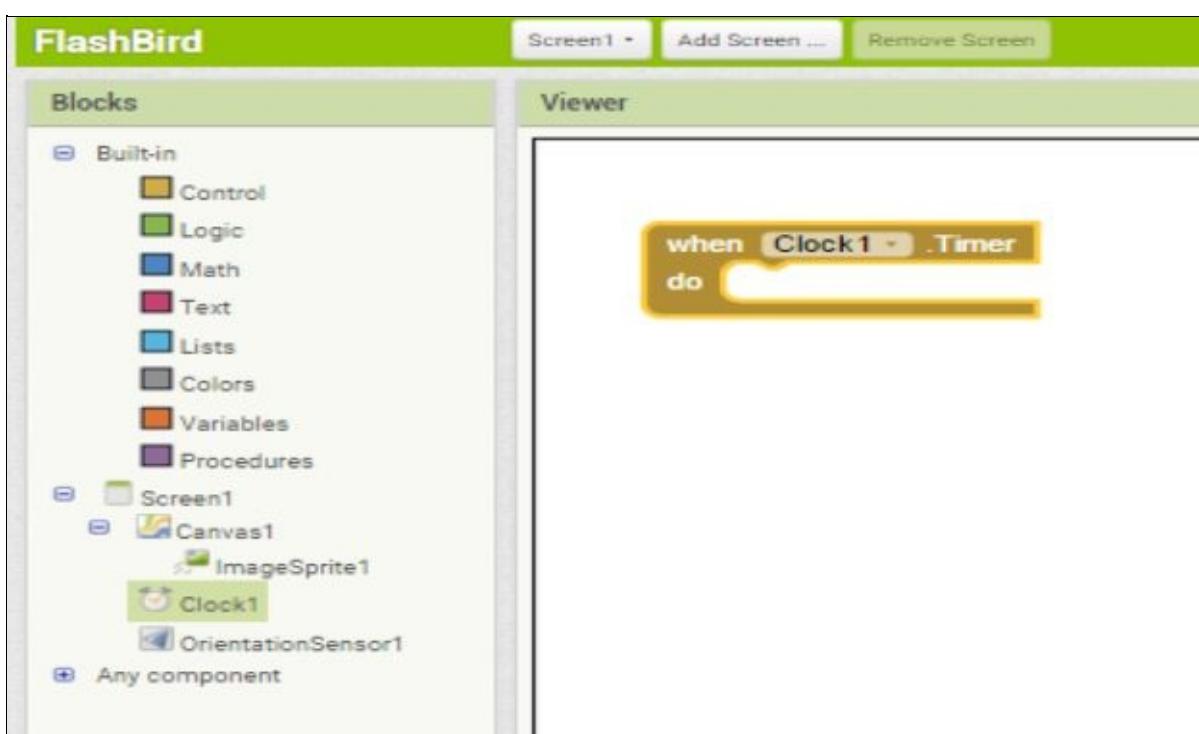

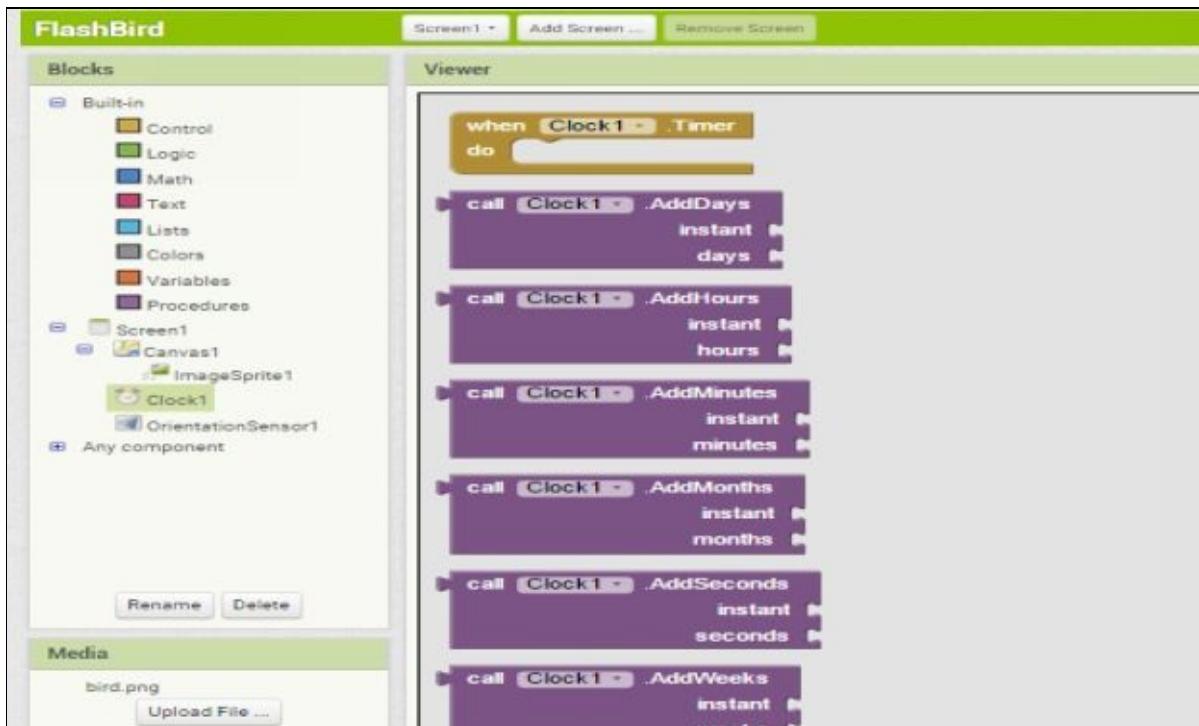

6. Change **ImageSprite1's Height** and **Width** both to 50 pixels.

7. Drag an OrientationSensor and Clock from Palette to Viewer and set Clock1's TimerInterval to 10.

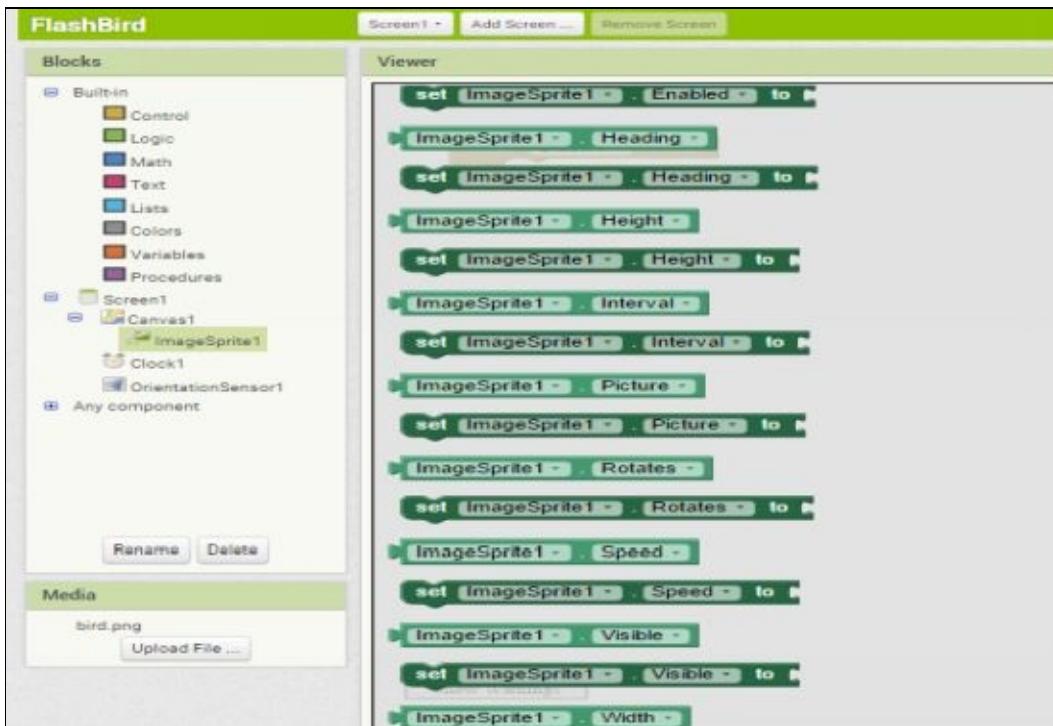

8. Go to Blocks and click on Clock1 and select **block**. This block will decide what to do when Clock Timer completes it's given duration everytime.

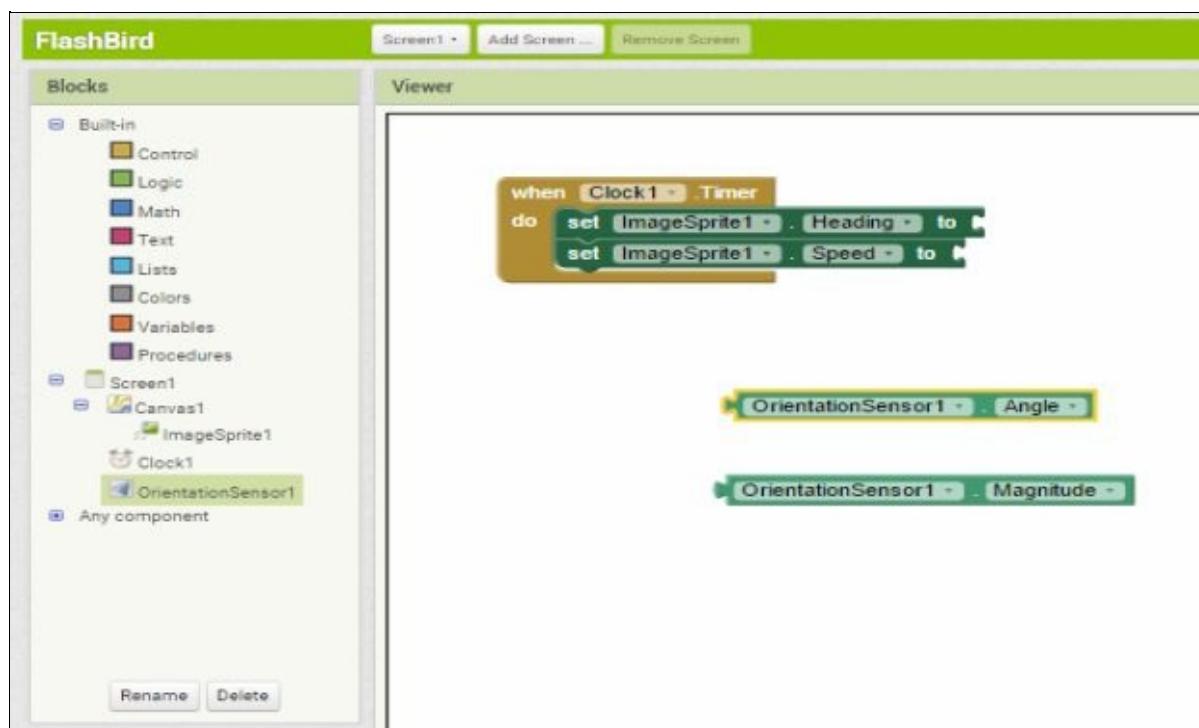

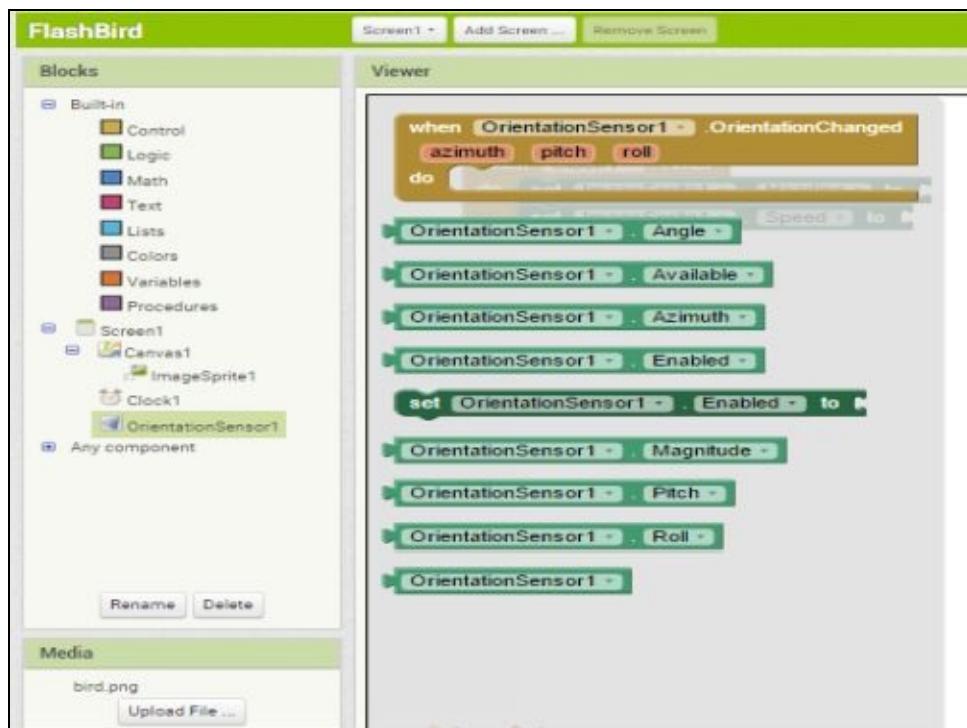

9. Click on [ImageSprite1](#) and scroll down to select [blocks](#). These blocks will set ImageSprite's speed and direction.

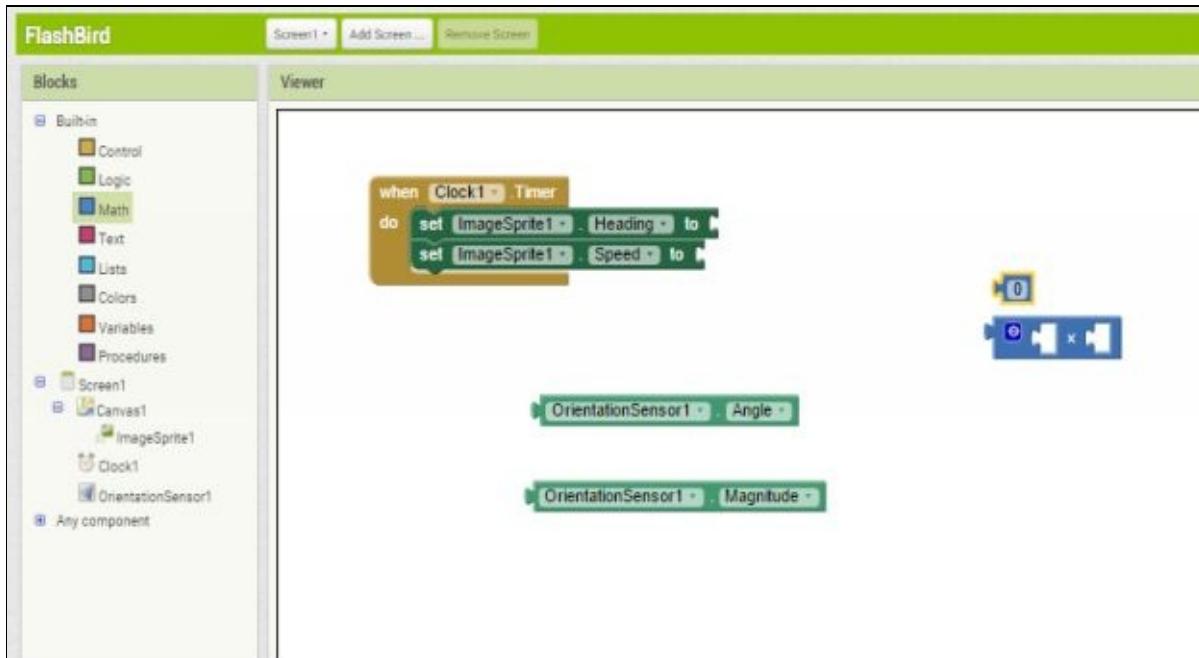

`set [ImageSprite1 . Heading] to [ ]`  
`set [ImageSprite1 . Speed] to [ ]`

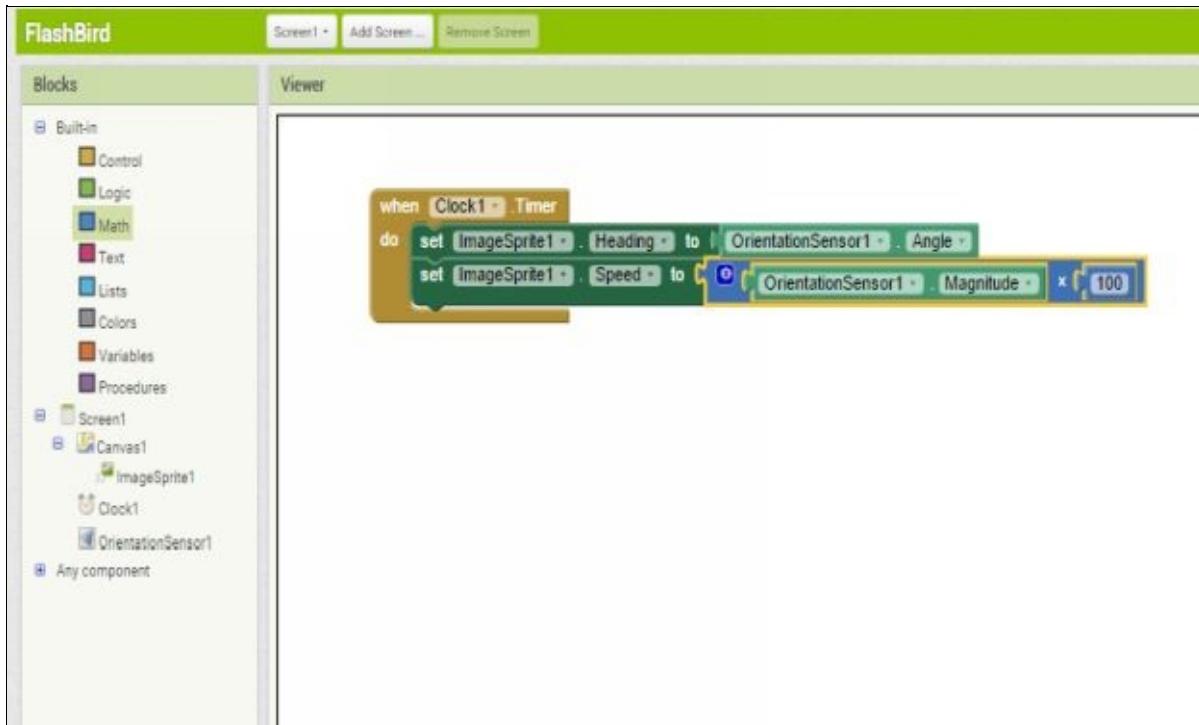

10. Click on **OrientationSensor1** and select **blocks**. These blocks will represent angle and magnitude of your Phone's tilt.

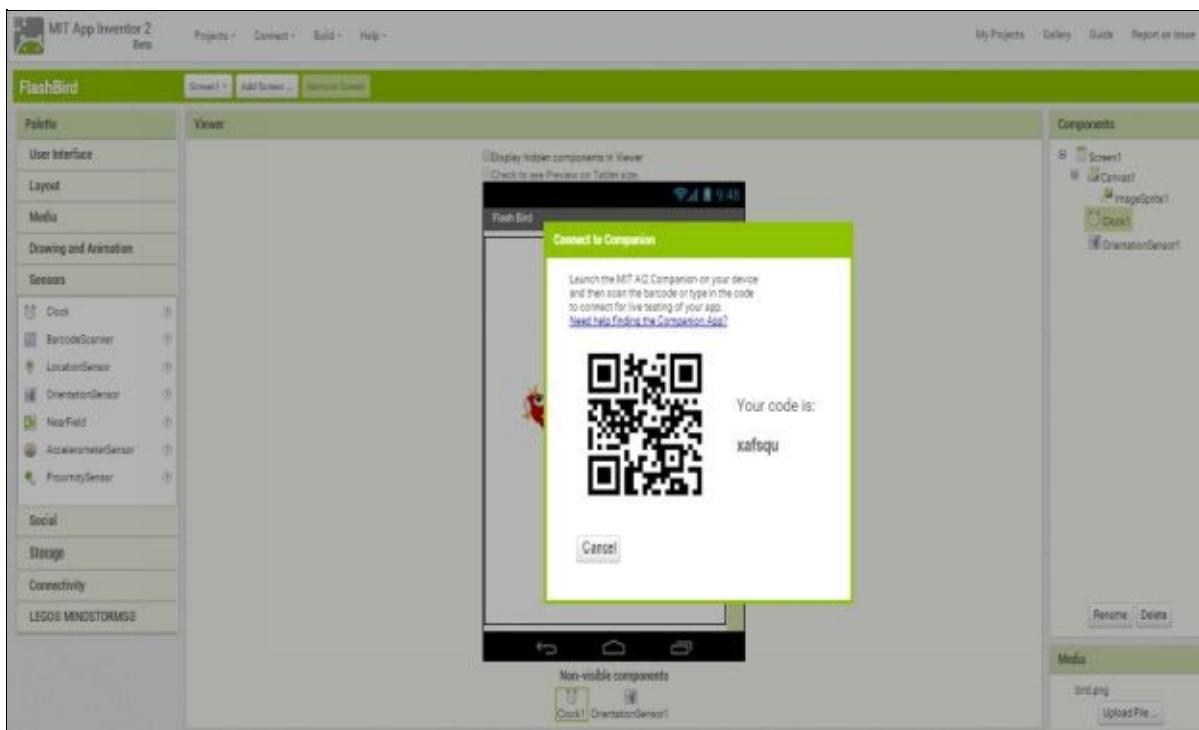

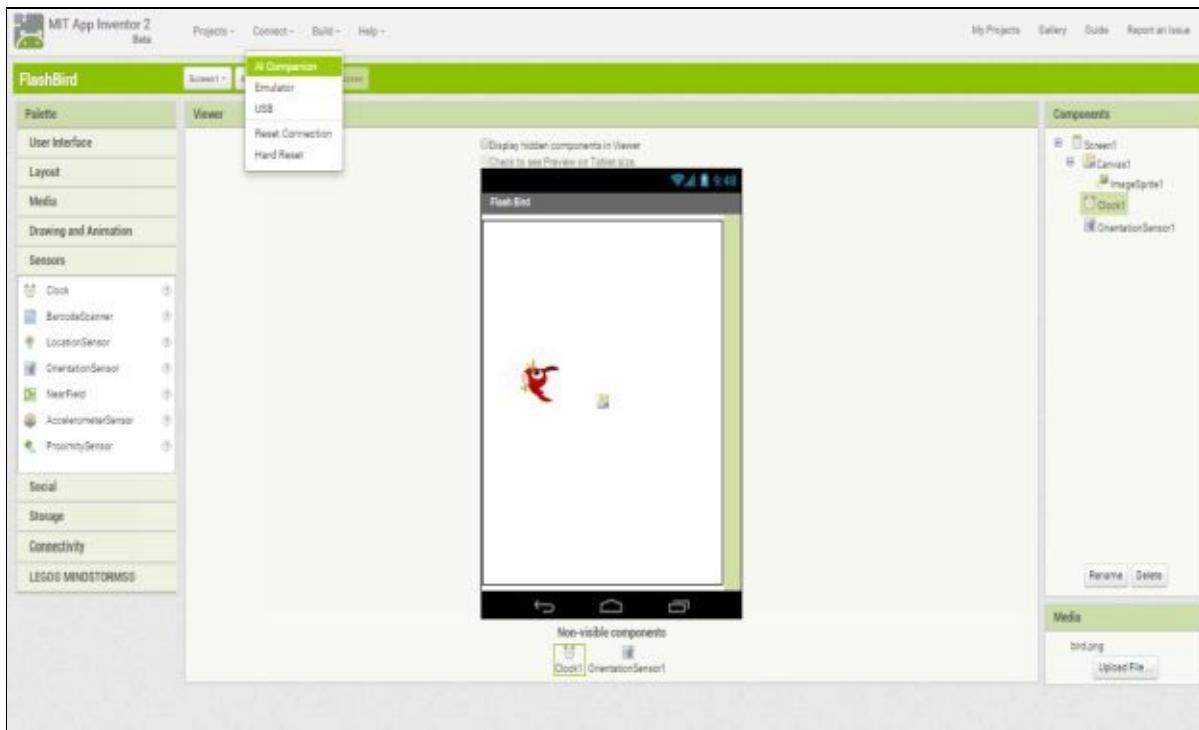

11. Click on **Math** under **Built-in** and select  blocks.

12. Attach the **blocks** as shown. So Everytime Timer duration gets completed app will move ImageSprite to your tilt direction angle and with the speed of tilt's magnitude \* 100.

13. Go to **Designer** and click on **Connect** then Select **AI Companion**.

14. Now open [MIT App Inventor 2 Companion](#) in your mobile/Tablet.

And enter the code or scan the [QR code](#) from your mobile and click on connect with code.

Note:-Your Mobile/Tablet should be connected to same wi-fi/network to which your computer/Laptop is connected.

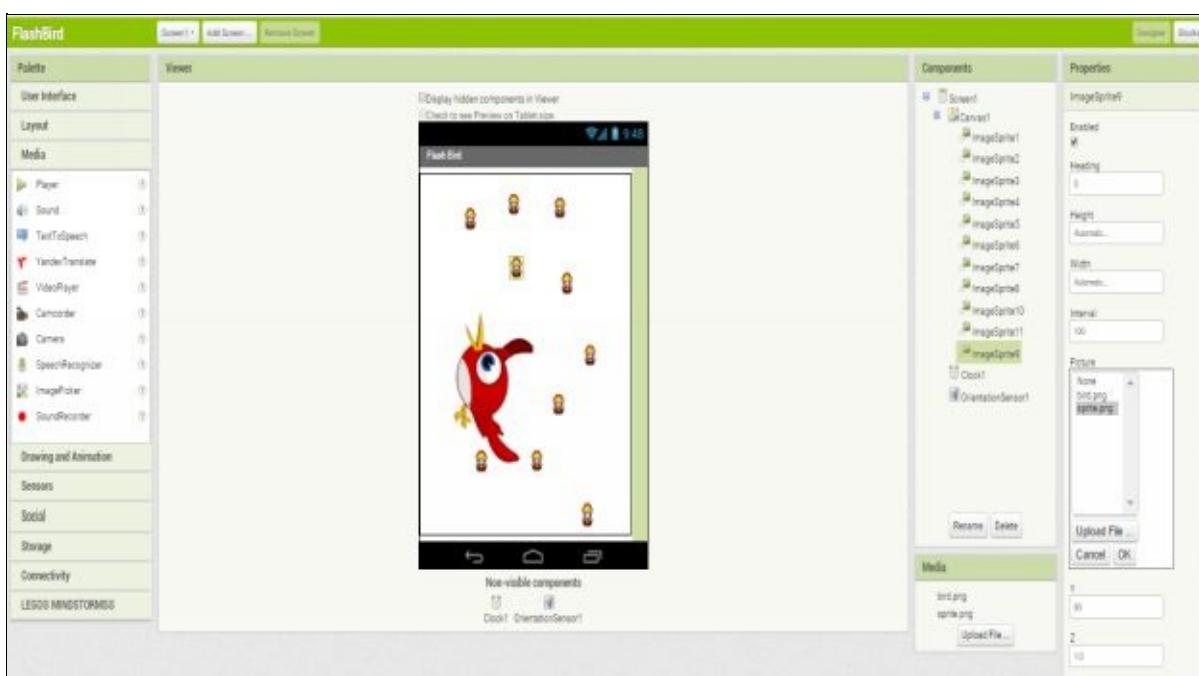

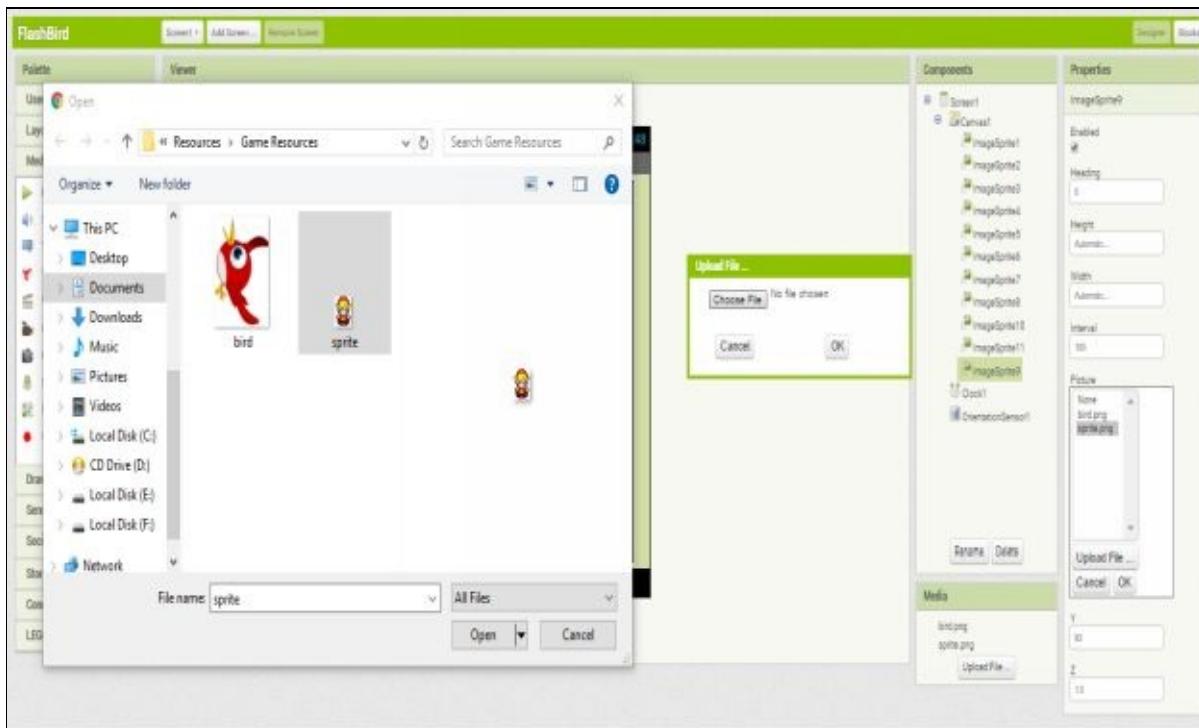

15. Now you should see your app in your phone for live testing. [Tilt your phone to move the bird.](#)

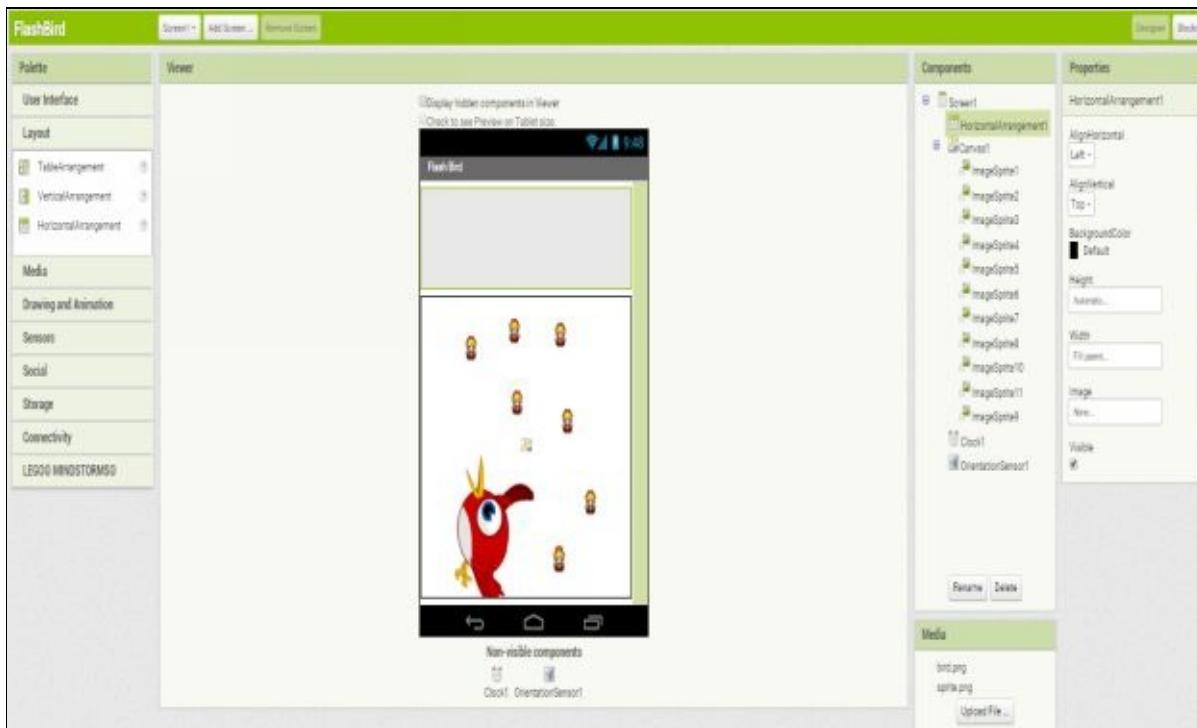

## Chapter 26 Flash Bird Game (Extending Previous app)

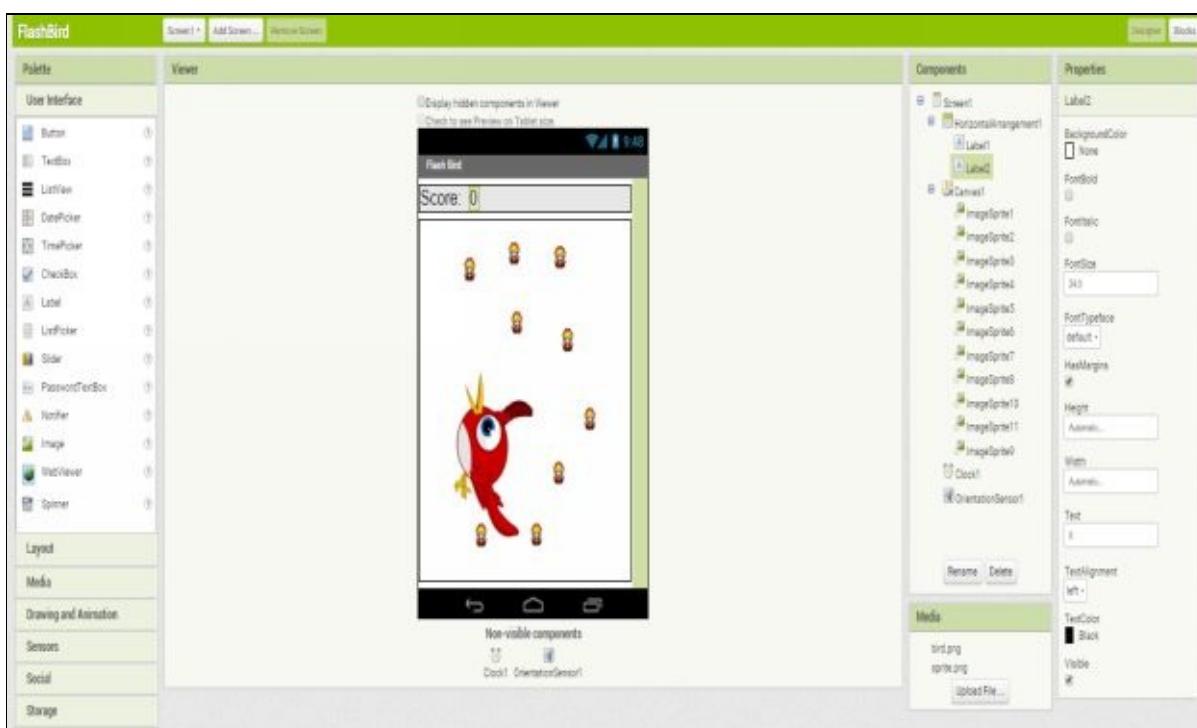

16. Open your [FlashBird](#) app and Drag 10 more [ImageSprites](#) from [Palette](#) to [Viewer](#) screen and set their [picture](#) as [sprite.png](#).

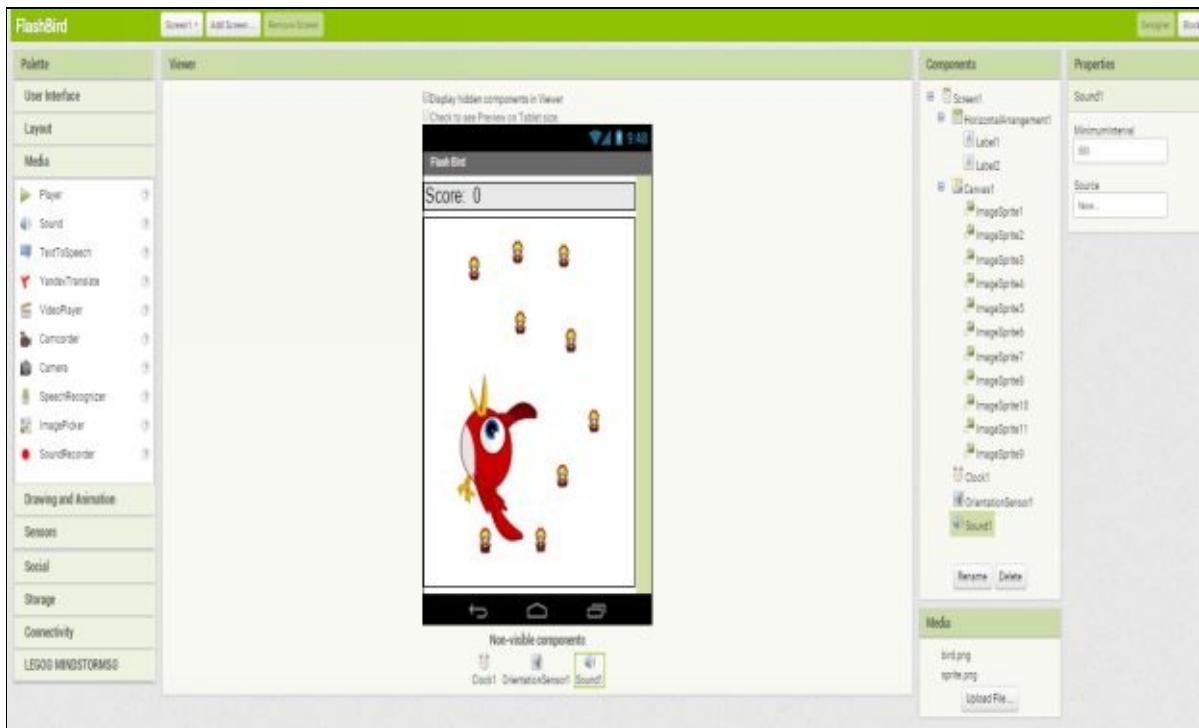

17. Drag a **HorizontalArrangement** from Palette to Viewer and set its **Width** to **Fill parent**.

18. Drag two **Labels** from **Palette** to **Viewer** and set first **Label's Text** as **Score:** and Second **Label's Text** as **0**.Also set **FontSize** to **24.0** for both Labels.

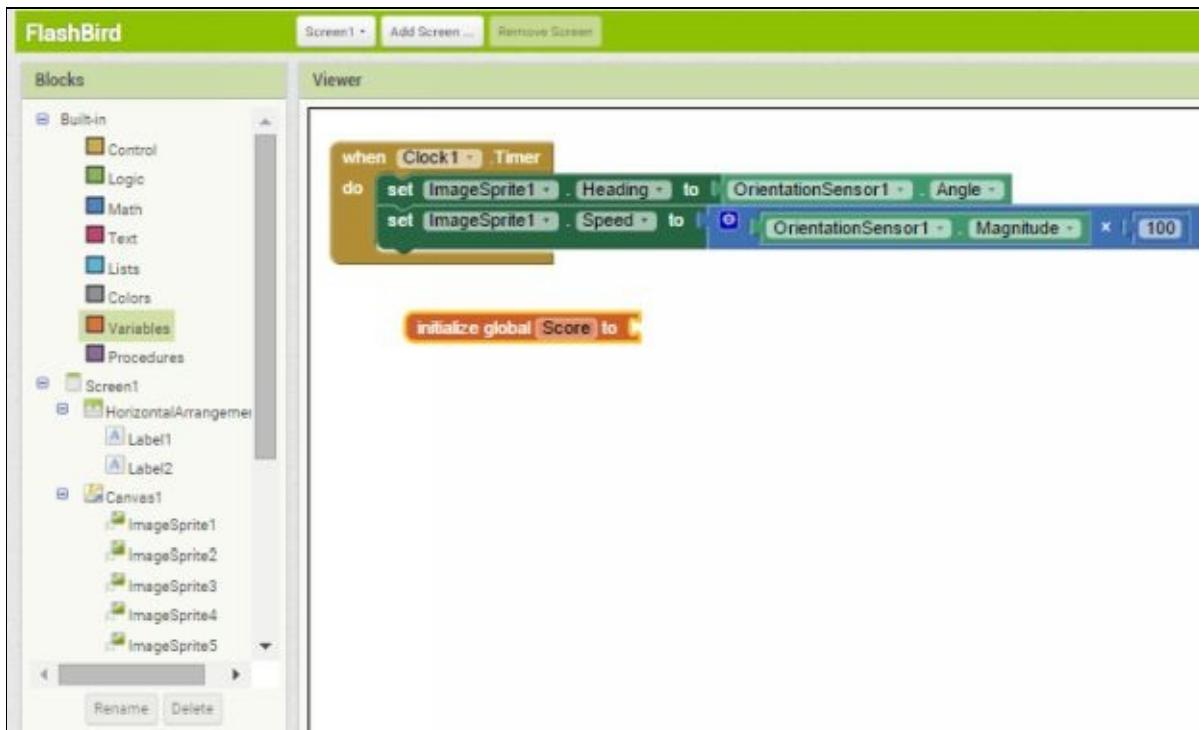

19. Drag a **Sound** Component from palette to viewer.

20. Go to **Blocks** and click on **Variables** under **Built-in** and select **initialize global [name] to [value]** block. And change **name** to **Score**. This is called defining a variable. A variable is a placeholder of a value which can be updated.

21. Click on **Math** under **Built-in** and select **block**. Here we are initializing the Score variable to 0.

22. Click on **ImageSprite1** and select **block**. This will identify the Collide event for ImageSprite1 and will decide what to do when ImageSprite1 collides with other ImageSprites/objects in the game.

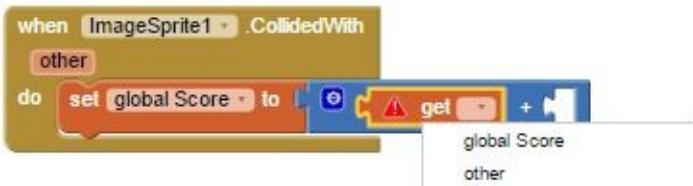

23. Click on **Variables** and select block and select **global Score** as **Variable name**. This block will set the value for Variable.

24. Click on **Math** and select block.

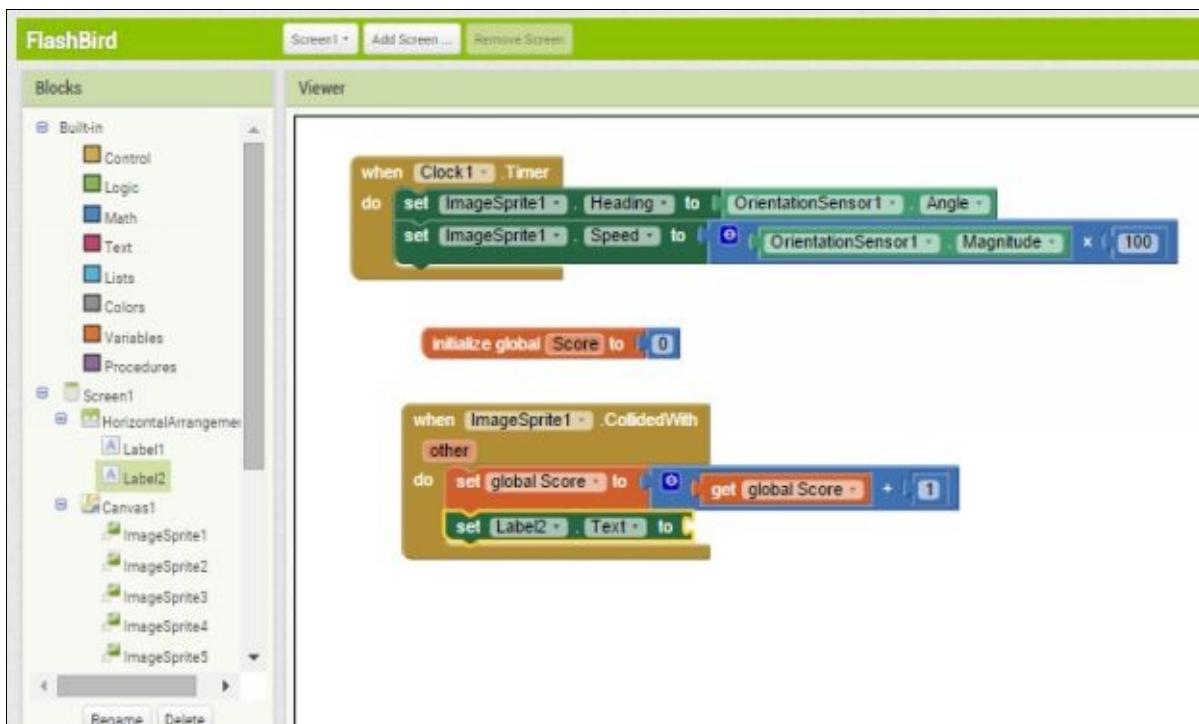

25. Click on **Variables** and select **get** block and select **global Score** as **variable**. This block will return the current value of Score variable.

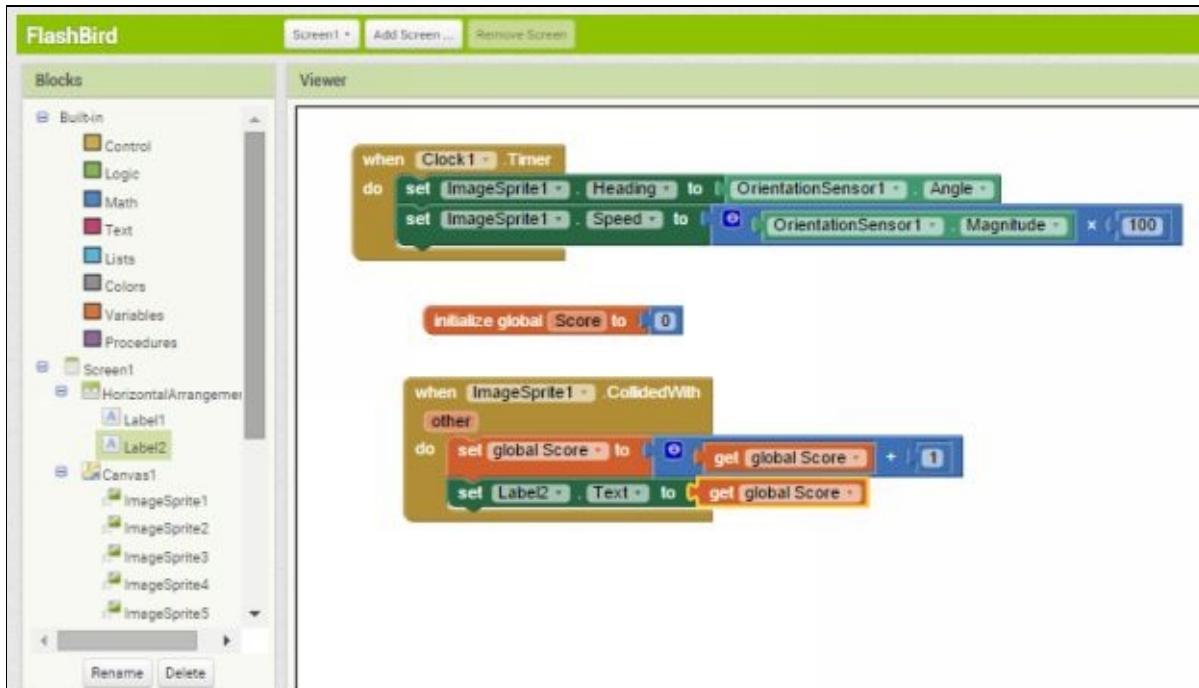

26. Click on **Math** and select  **block** and change its **value to 1**. So that when ImageSprite1 collides with other ImageSprites, your Score variable's value will be increased by 1 more than current value.

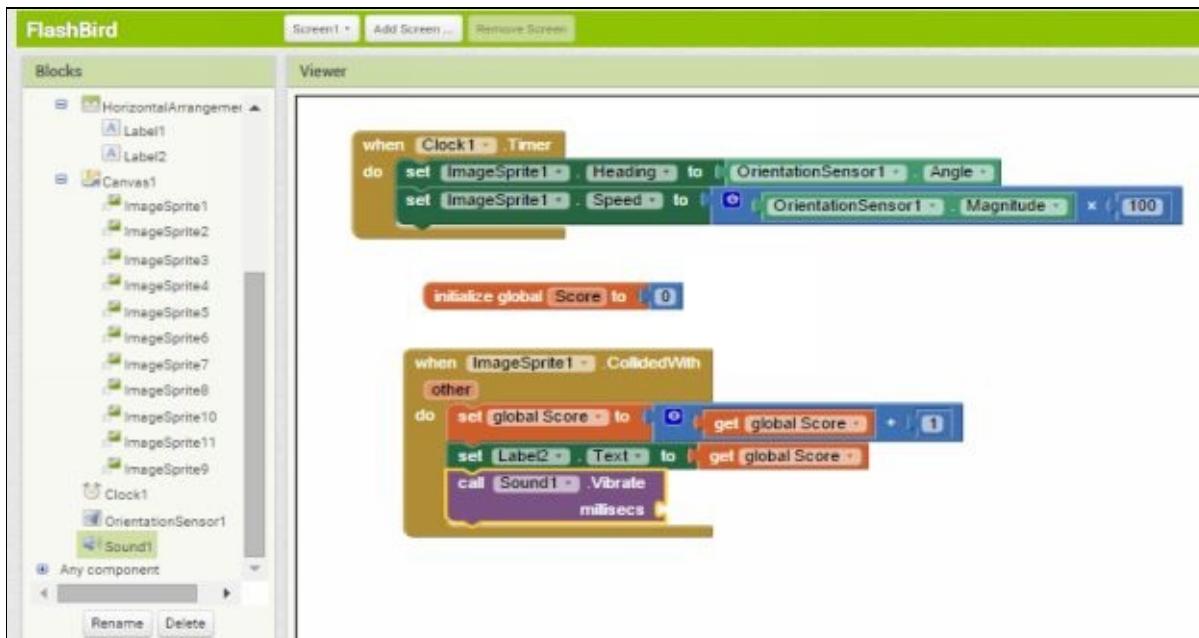

27. Click on **Label2** and select  **block**.

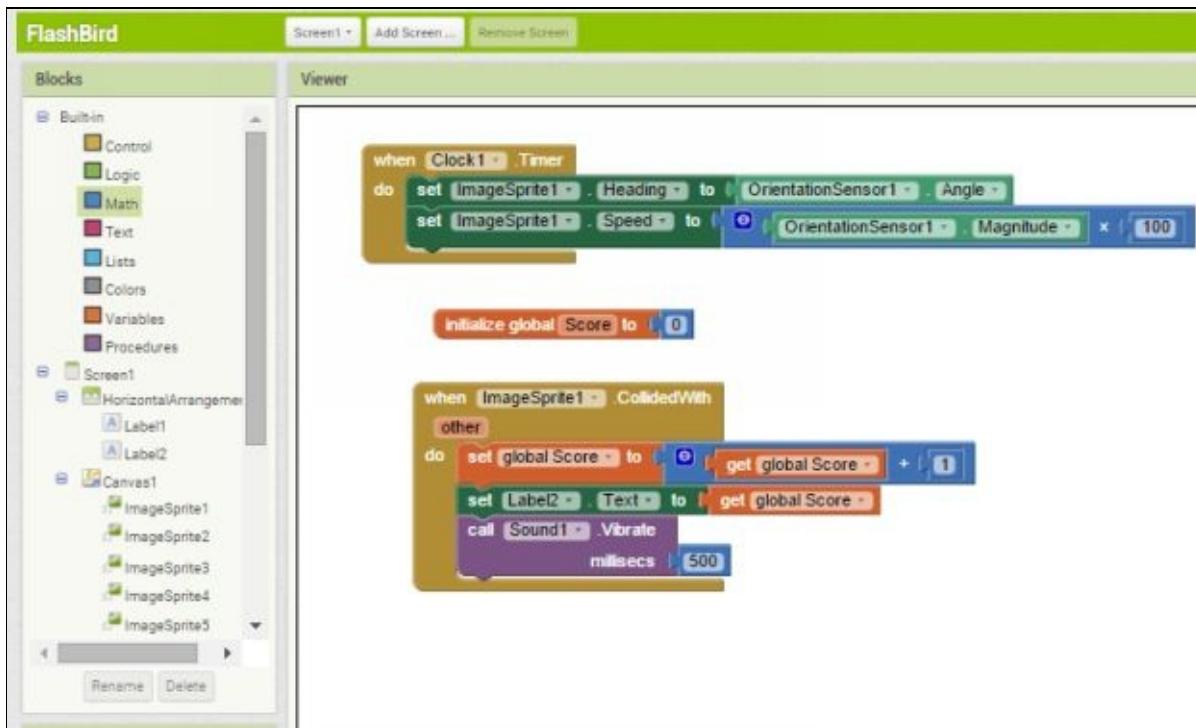

28. Click on  **and copy it**. This block will return the current value of Score variable. So everytime ImageSprite1 collides with others your Score will be increased by 1 and set it as Label2's Text.

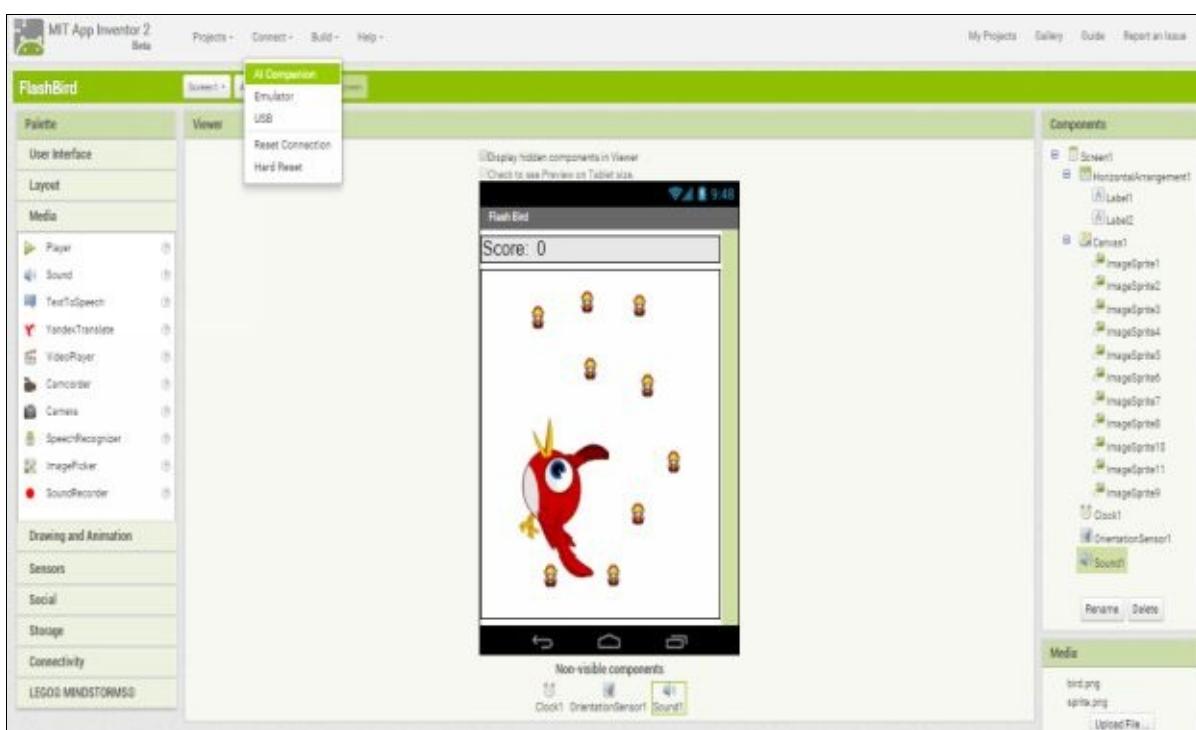

29. Click on **Sound1** and select block. This block will make your phone to vibrate.

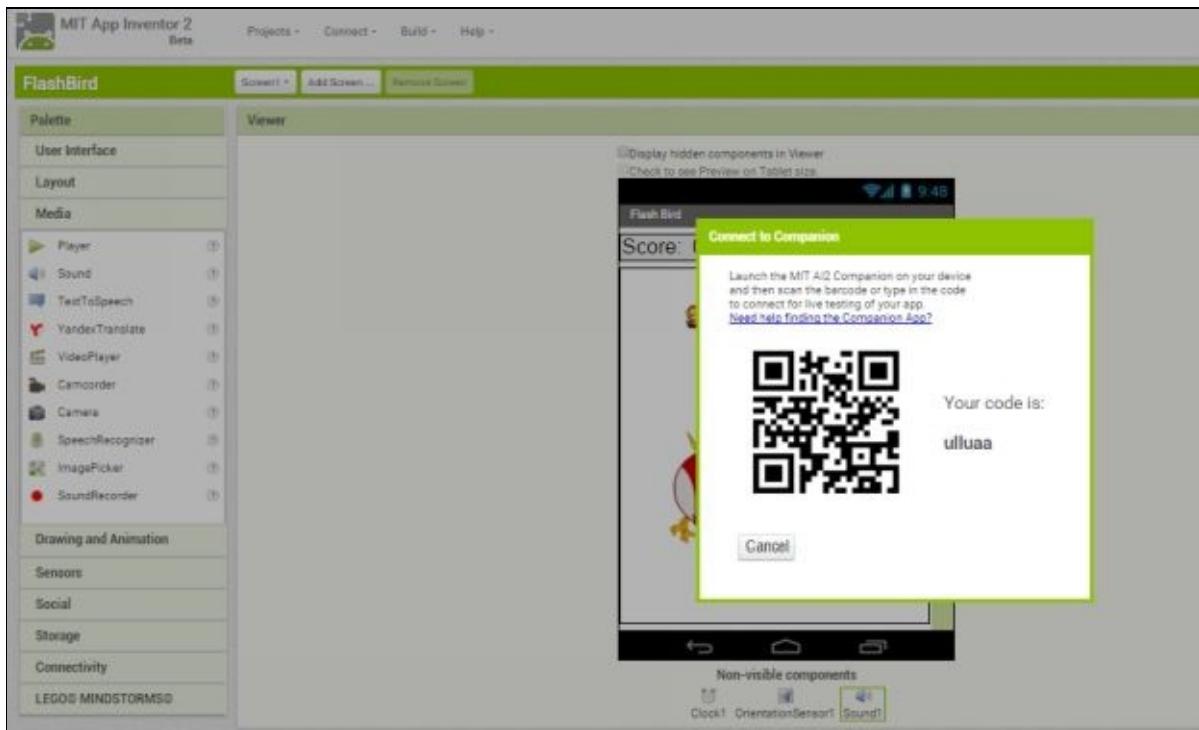

30. Click on **Math** and select block and change its value to 500.

31. Go to [Designer](#) and click on [Connect](#) and then select [AI Companion](#).

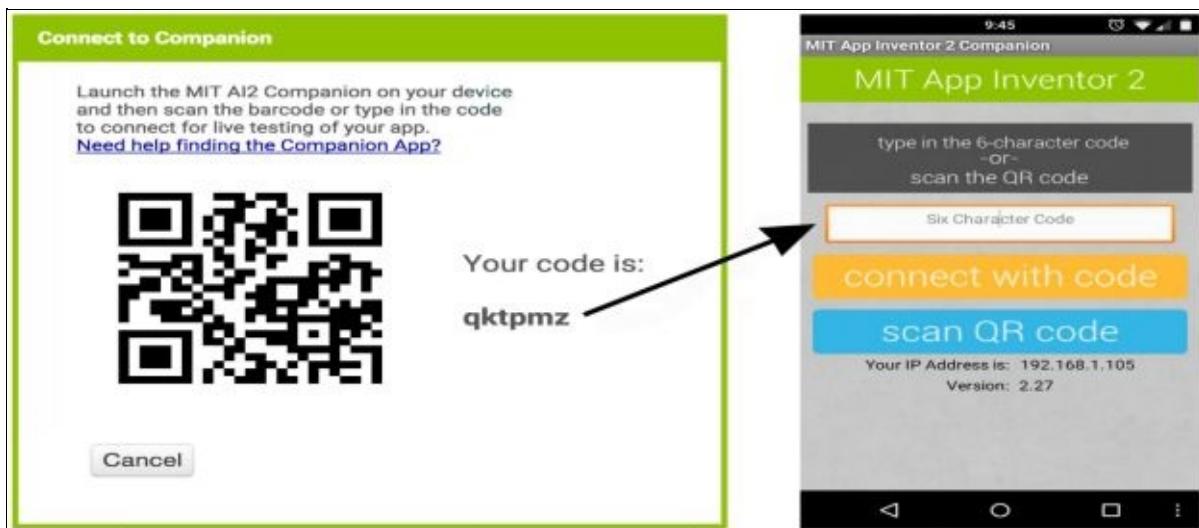

32. Now open [MIT App Inventor 2 Companion](#) in your mobile/Tablet.

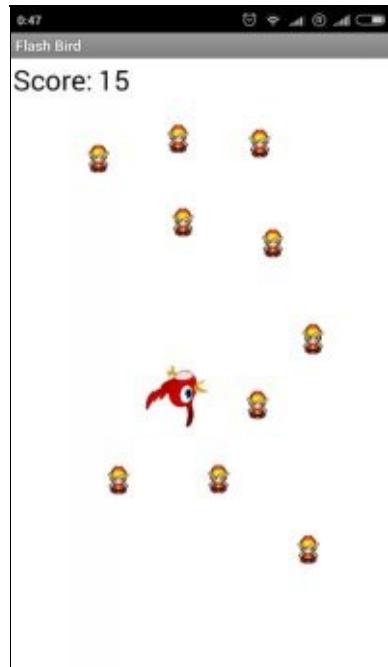

And enter the code or scan the QR code from your mobile and click on connect with code.

Note:-Your Mobile/Tablet should be connected to same wi-fi/network to which your computer/Laptop is connected.

33. Now you should see your app in your phone for live testing. [Tilt your phone to move the bird and when bird touches any of the sprite your phone will vibrate and score will increase. This is just a simple way to demonstrate how you can build logic to create games using app inventor.](#)

[Try to create some more complex games.](#)

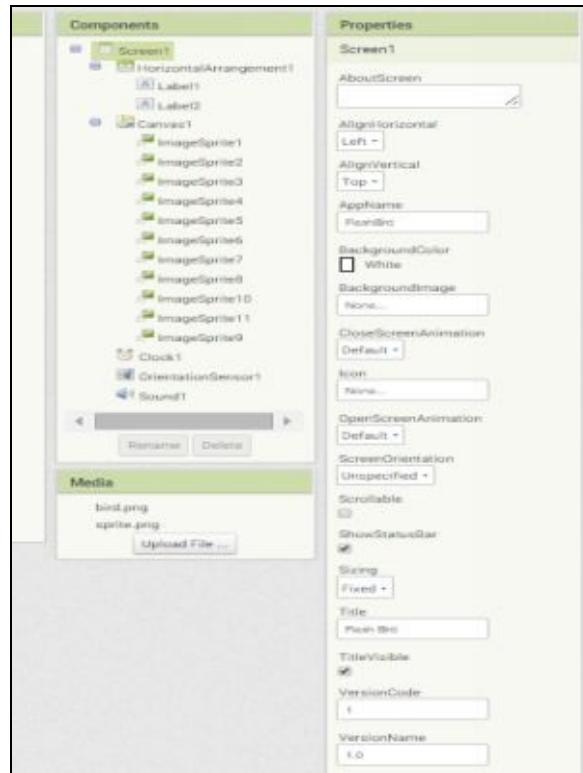

## Chapter 27 Packaging & Publishing to Google Play Store

### Packaging:-

Applications built with App Inventor can be uploaded to Google Play!

1. Open your app and click on **Screen1** and Set following Properties.

- **AppName**
- **VersionCode**
- **VersionName**

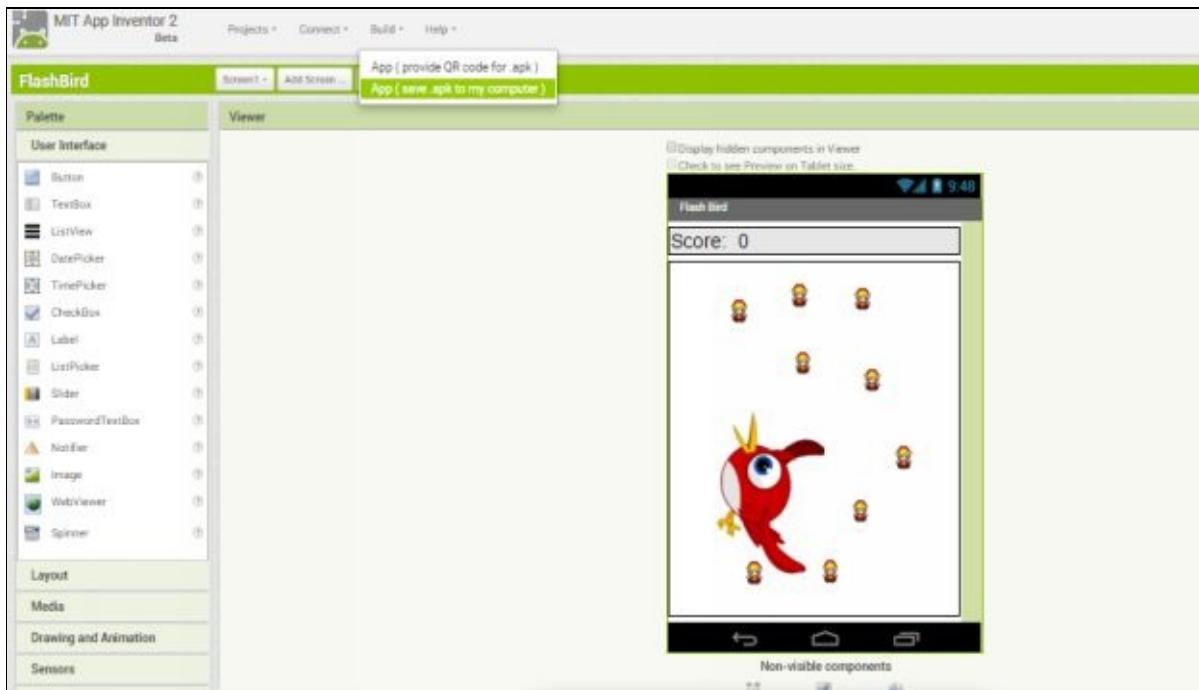

Every app you publish must have a [VersionCode](#) and a [VersionName](#). You can set these in the [designer](#) under the [properties](#) panel for the [Screen1](#) component.

[VersionCode](#) is an integer value that will not be visible to [Google Play Store users](#). It is used by other apps to check if your app has been upgraded or downgraded. It defaults to 1 and should be increased by one with every successive change whether it is a major change or a minor change.

[VersionName](#) is a String which can be anything you would like. It is defaulted to 1.0. A common structure is a decimal number which is increased by 1 for every major change and 0.1 for every minor change. For example, an initial [VersionName](#) could be 1.0 which can be updated to 1.1 after a small change and 2.0 after a larger change.

You will need to increase the [VersionCode](#) and change the [VersionName](#) of your application when you upload a new version to the [Play Store](#).

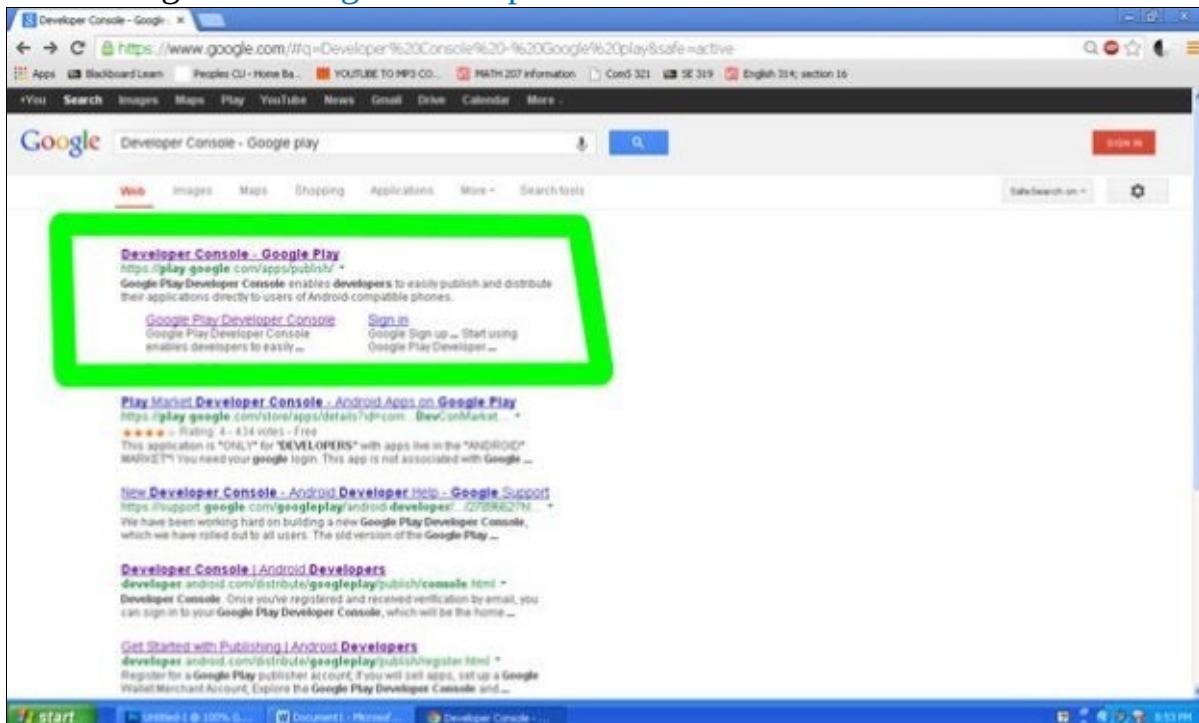

2. Click on [Build](#) and then click on [App \(save .apk to my computer\)](#).

This will prompt you to save the application somewhere. Once you have the .apk downloaded, you are ready to begin the publishing process.

### Publishing Apps to Google Play:-

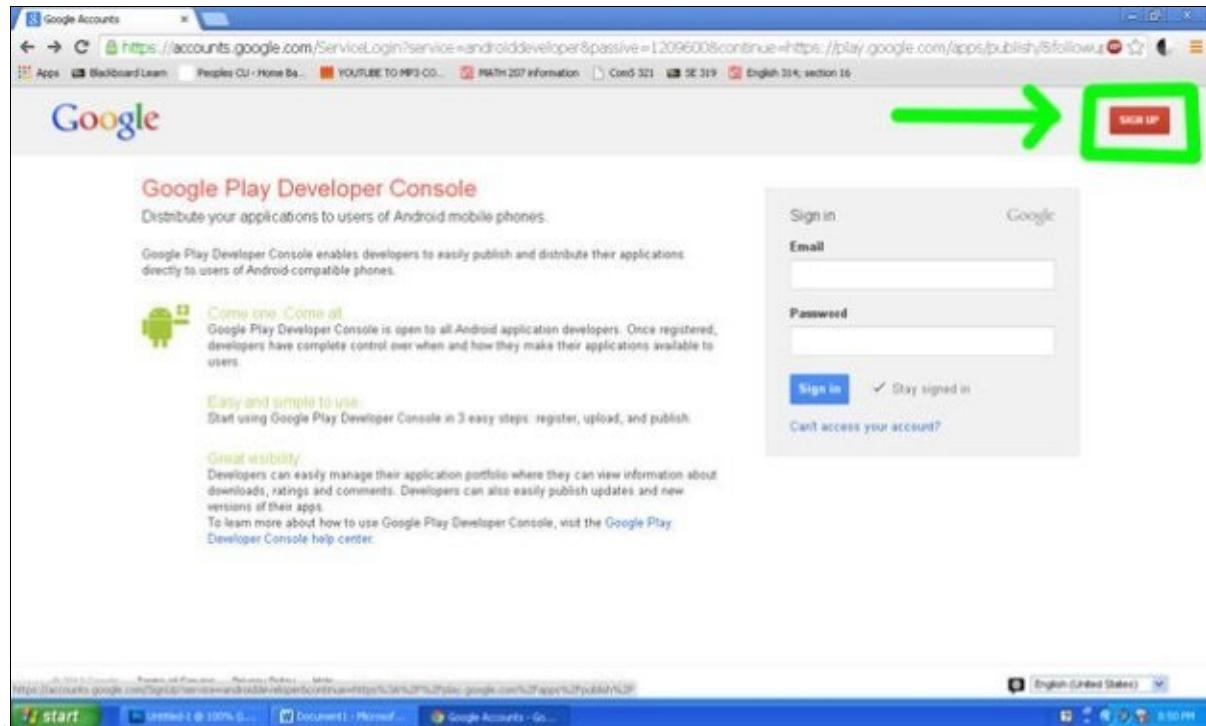

#### 1. Navigate to Google Developer Site.

Open up a web browser, search for “[Developer Console - Google Play](#),” and navigate to the site with that as its name.

The proper site is shown in the green box in the figure attached to this step.

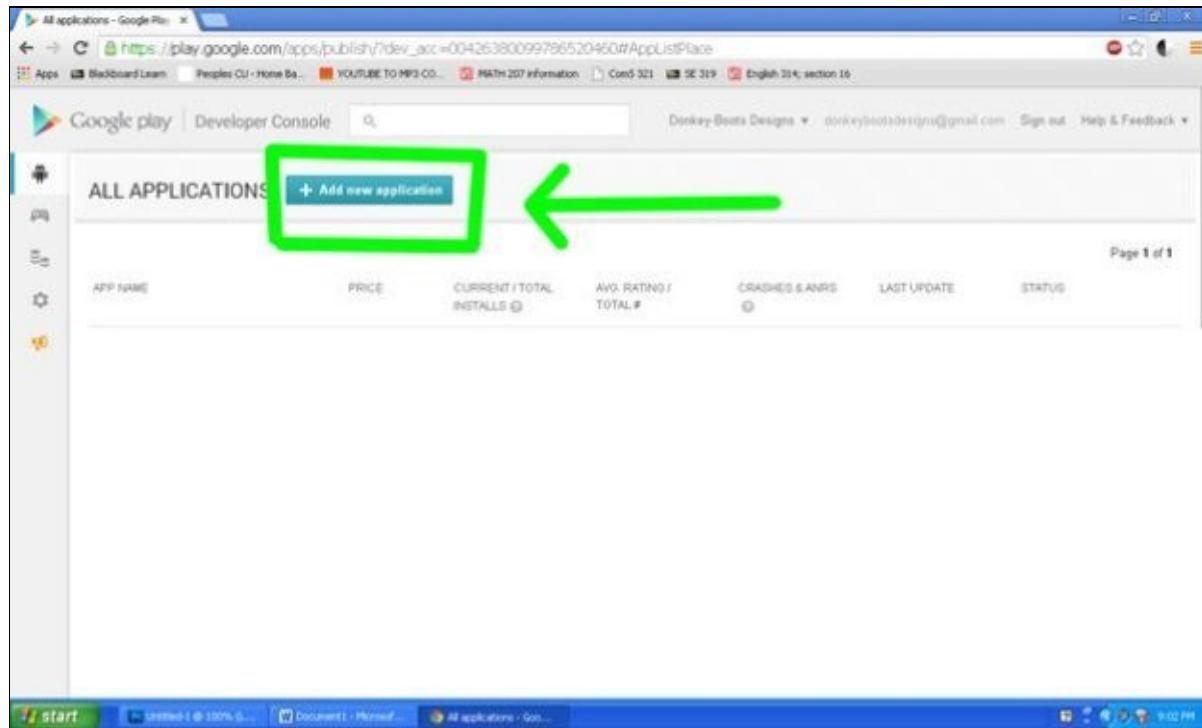

## 2. Login to Google Developer Console

Get logged in to [google's developer console](#).

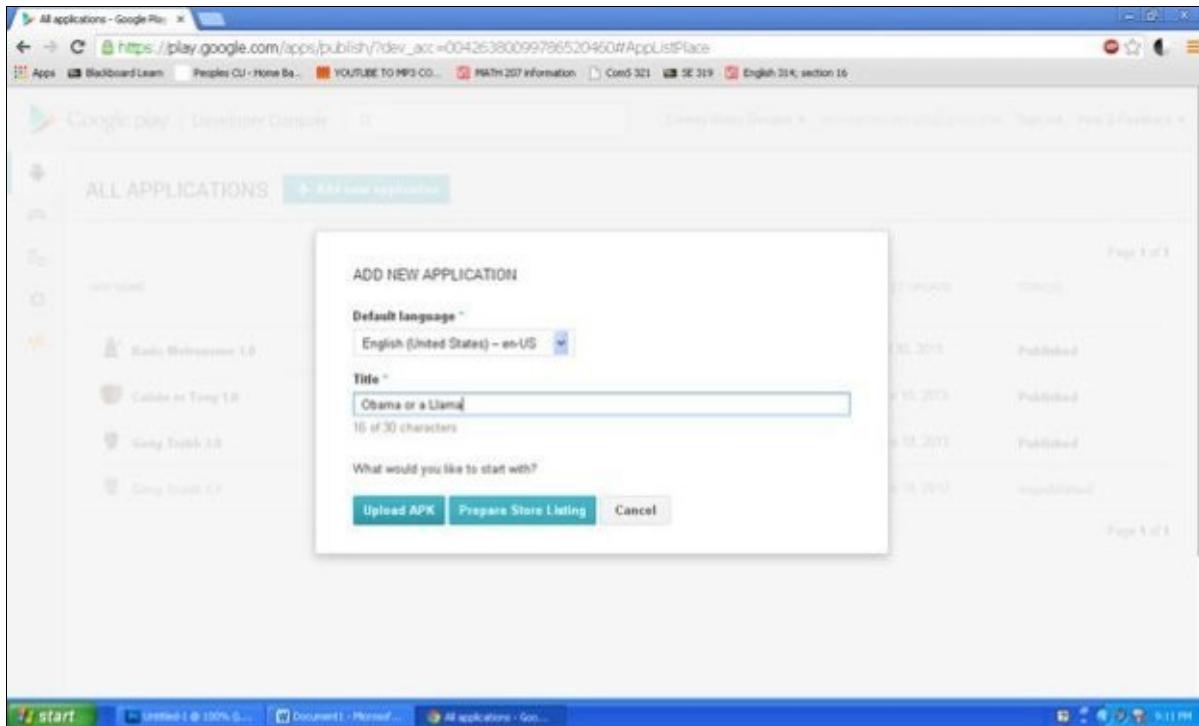

If you do not already have a [google developer account](#), follow Google's steps to create one, by clicking "[Sign Up](#)," in the top-right of your screen. The last step in the process of creating a [developer account](#) is paying a one-time \$25 developer fee using a credit or debit card.

### 3. Adding a New Application.

Once inside the [console](#), click the [blue button](#) at the top labeled, “[+ Add New Application.](#)”

#### 4. Initiating APK Upload.

In the “[Add New Application](#)” dialog, ensure that the correct [language](#) is selected from the drop-down menu and then type the name of the app as you wish for it to appear in the [Google Play store](#).

Then, select the “[Upload APK](#)” button at the bottom.

The [console](#) will then take you to the new homepage for your app.

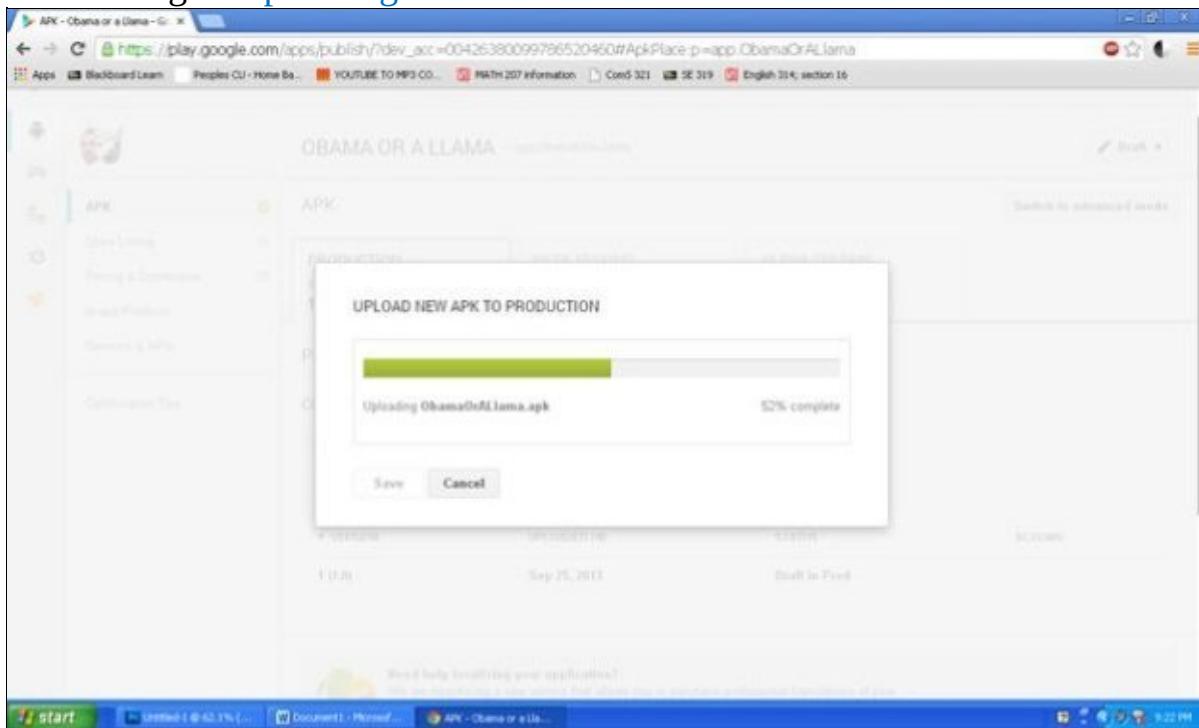

## 5. Initiating APK Upload (part 2).

At the new homepage for your app, select the blue button labeled “**Upload your first APK to Production**,” centered on your screen.

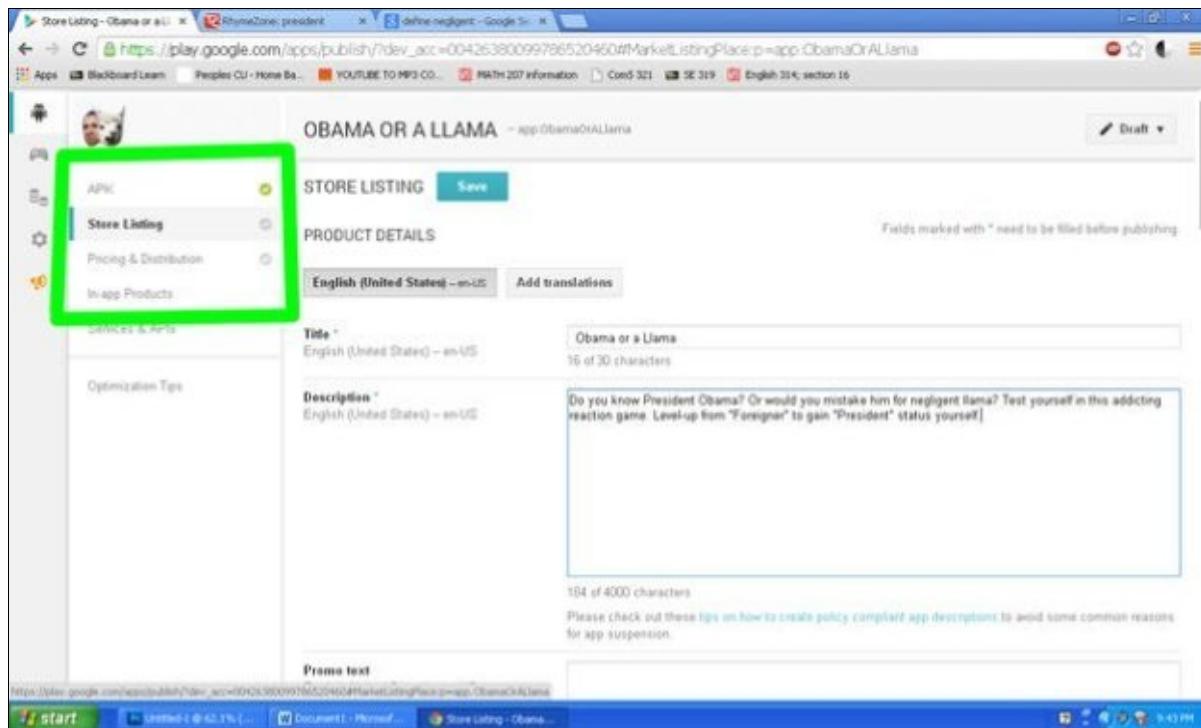

## 6. Selecting & Uploading APK File.

A dialog will appear, where you can “browse” and “open” your “.apk” file you downloaded.

Upload progress is shown, and if the upload is successful, you will be taken back to the console.

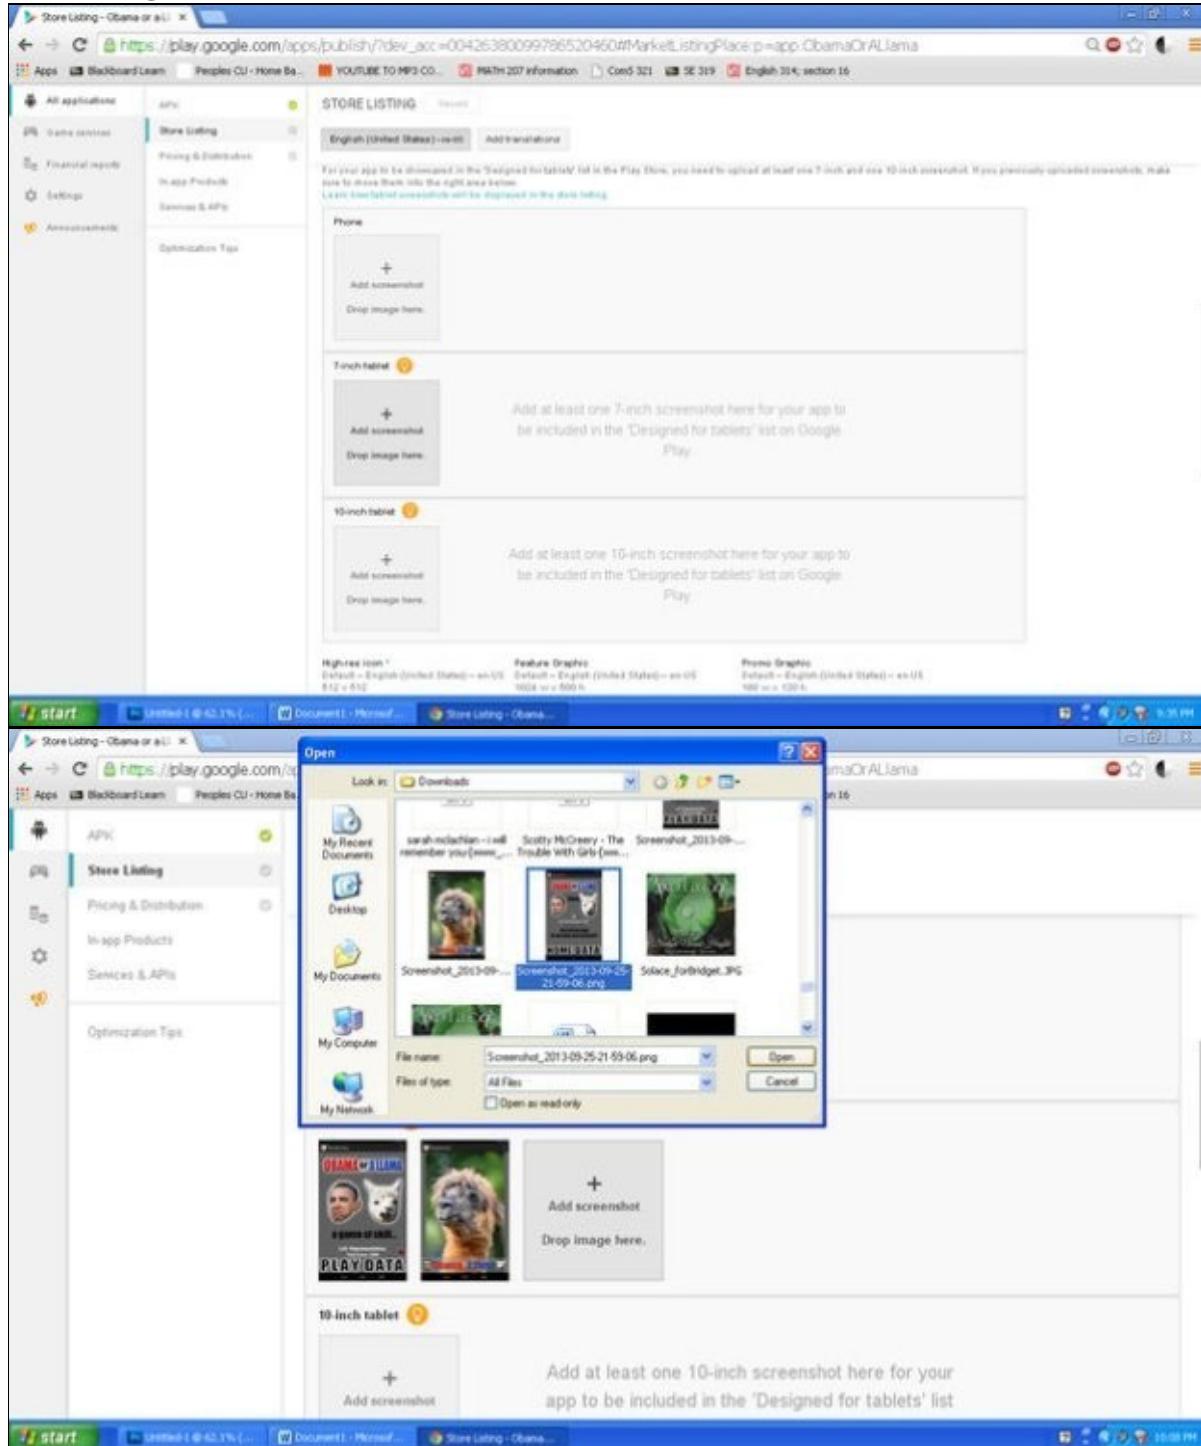

## 7. Adding a Description.

After successful uploading of the APK, a description needs to be added to the “store listing” page found by navigating the tabs at the left (tabs are shown in green box in attached figure).

Type an application description in the “description” text box. The description will appear in the Google Play store on the page for your app.

## 8. Adding Screenshots.

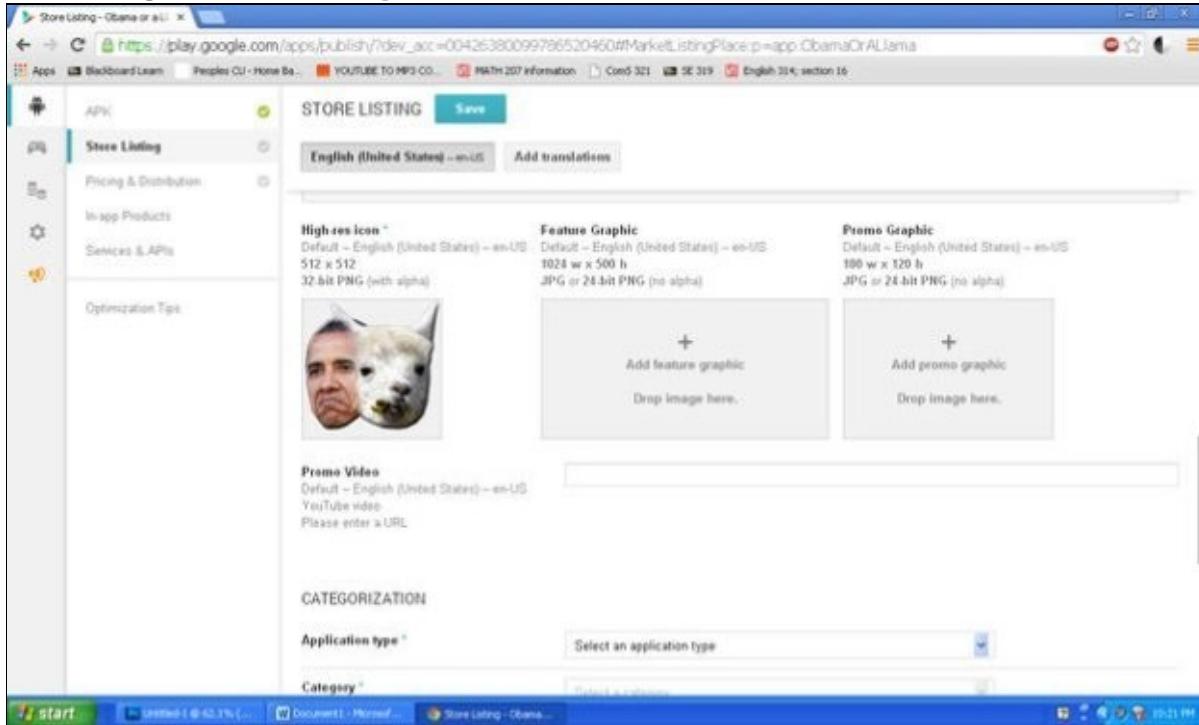

The next step in the “**Store Listing**” tab is adding sample screenshots.

To upload screen-shots, scroll down and click one of the three “**+ Add Screenshot**” buttons corresponding to the type of device they were taken on.

A browse dialog box will open allowing you to select the screenshots from a directory on your computer.

## 9. Adding a Store Listing Icon.

Next, add a store listing icon.

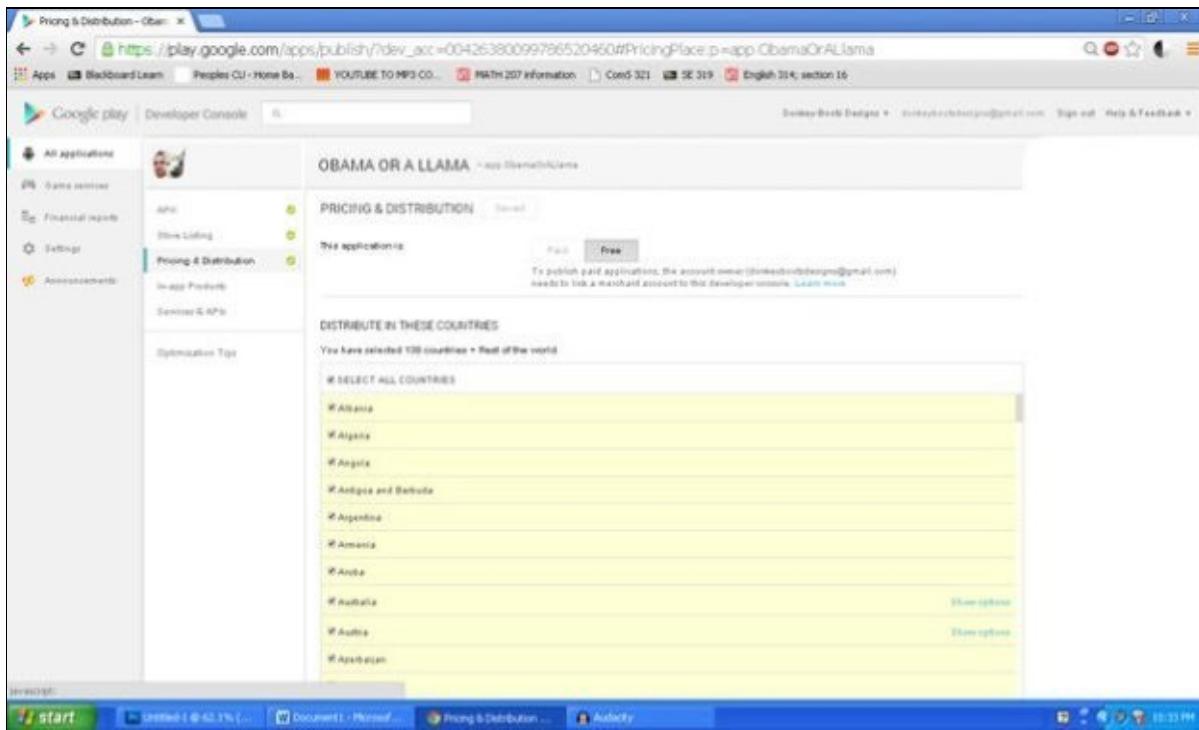

The listing icon is the main picture that pops up at the top of the screen in the Google Play Store.

A browse dialog box will open allowing you to select the icon the same way Step 17 allowed you to select a screenshot.

## 10. Filling in Details

The final step on the “[Store Listing](#)” page is filling out the categorization, contact details, and privacy policy, located below the icon selection area.

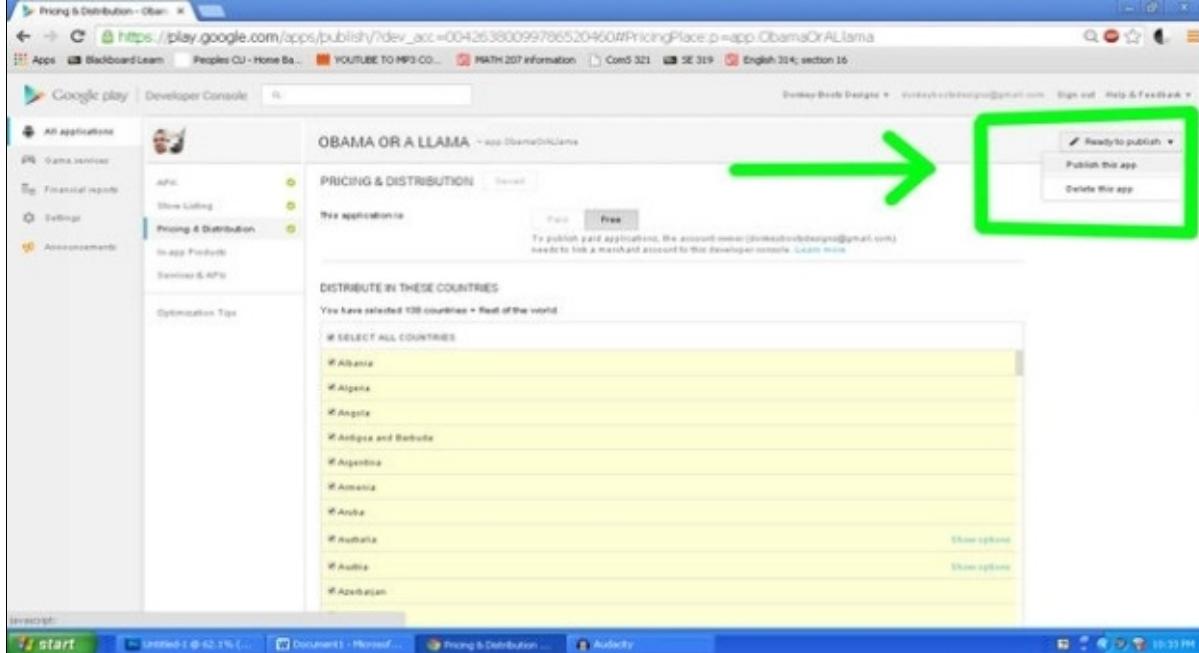

Fill out the required fields as you wish and hit save. The “[store listing](#)” tab should now have a green check-mark next to it.

Finally, click the “Pricing & Distribution” tab, where you will select paid or free, distribution countries, and check the boxes saying that your app complies with content guidelines and US export laws.

Select “Save,” at the bottom.

## Step 11: Publishing the Application.

Once all three tabs at the left have a green check-mark, you are now able to select “Publish this app” from the “Ready to Publish” drop-down menu in the top right corner of the developer console.

A confirmation bar should appear at the top, stating that your app will appear in the Google Play store in just a few hours.

## Step 12: Conclusion

This completes publishing an Android app to the Google Play Store.
